News of the death of Flight Sub-Lieut. J. Russell Chamberlin, of the Royal Flying Corps, which was received in Toronto on June 3rd, was a great shock to his many friends in the lumber trade. The late Flight Sub-Lieut. Chamberlin was a son of Mr. Jas. E. Chamberlin (of the Hugh McLean Lumber Company), 86 Pleasant Blvd., Toronto. His death was the result of an aeroplane accident which occurred at Netheravon, England, on the morning of June 2nd. Mr. Jas. E. Chamberlin got in touch with friends in England by cable and made arrangements for having the body of his son brought to Canada for burial.

Flight Sub-Lieut. J. Russell Chamberlin was born in Ottawa 25 years ago. He was educated at Jarvis Collegiate Institute, Toronto, and subsequently attended the University of Toronto, where he graduated from the Department of Forestry two years ago. During his course at the University he was proprietor of the J. R. Chamberlin Company, dealers in typewriter supplies, and in this way helped to finance his University course. Upon graduation he went to Victoria, B. C., where he had already secured an appointment with the Forestry Branch of the Department of Lands of B. C. In this position he did excellent work and was sent to Toronto last fall to install an exhibit of B. C. forest products at the Canadian National Exhibition. While in Toronto at that time he applied to be taken on as a student at the flying school in Toronto. He found that he would have to wait his turn, however, and in the interval returned to B. C. He was back again in Toronto early in the winter and sailed from St. John, N. B., on January 1st to take the aviation course in England. He had recently completed the course and was doing practical work preparatory to going across to France. Letters received recently by Mr. J. E. Chamberlin from his son stated that he had been in hospital for a short time as the result of a cold, but on May 20th he was back again at his aviation work.

The late Flight Sub-Lieut. Chamberlin will be well remembered by many lumbermen in Toronto, who will recall having heard him deliver an excellent address before the Lumbermen's Section of the Toronto Board of Trade on September 10th, in the course of which he explained the qualities and advantages of B. C. timber and lumber. His address at that time was an important factor in developing the remarkable interest in B. C. products which has since been increased greatly by the publicity work of the Forest Branch. The late Flight Sub-Lieut. Chamberlin also addressed the retail lumber dealers of Winnipeg on July 14th.

Mr. L. B. Beale, B. C. Lumber Commissioner at Toronto, when told of the death of Flight Sub-Lieut. Chamberlin, expressed great regret at the loss of such a promising young man. "J. R. Chamberlin," he said, "was one of the bright spots in the market extension and publicity work of the Forest Service. He had an excellent grasp of his subject and what was perhaps more, had a very attractive personality. He was esteemed highly for these qualities amongst all his confreres and his loss will be felt personally by many of them. He had a peculiarly winning manner and was a good mixer. These qualities, coupled with energy in his work, made him a splendid official of the Department."

Lumber Trade Between Canada and the United States

The annual report upon the lumber industry of the United States, issued by the Government, gives the following report of the quantities exported to Canada and their values, during the past three years:—

Export of Lumber from the United States to Canada

		1912	1913	1914
Logs and round timbers	Feet	55,973,000	66,448,000	3,561,000
	Value	$610,603.00	$715,126.00	$158,557.00
Yellow pine sawed timbers	Feet	13,183,000	16,698,000	18,398,000
	Value	$289,534.00	$425,158.00	$454,616.00
	Average	$21.96	$25.46	$24.71
Cypress—	Feet	.....	9,704,000	9,219,000
	Value	.....	$280,880.00	$254,907.00
	Average	.....	$28.93	$27.64
Fir—	Feet	189,185,000	140,335,000	71,053,000
	Value	$2,304,509.00	$1,931,485.00	$917,541.00
	Average	$12.18	$13.76	$12.91
Gum—	Feet	5,916,000	12,011,000	8,669,000
	Value	$152,998.00	$301,971.00	$208,992.00
	Average	$25.86	$25.14	$24.10
Oak—	Feet	57,504,000	72,351,000	56,712,000
	Value	$2,334,230.00	$2,877,282.00	$2,326,918.00
	Average	$40.50	$39.76	$41.30
White pine—	Feet	.....	4,482,000	9,308,000
	Value	.....	$155,731.00	$308,941.00
	Average	.....	$34.74	$33.19
Yellow pine—	Feet	150,882,000	171,880,000	158,787,000
	Value	$3,186,150.00	$3,898,314.00	$3,410,380.00
	Average	$21.11	$22.67	$21.47
Poplar—	Feet	6,902,000	5,537,000	3,808,000
	Value	$307,533.00	$222,470.00	$155,227.00
	Average	$44.41	$41.98	$40.76
Spruce—	Feet	2,229,000	3,013,000	2,495,000
	Value	$47,294.00	$49,876.00	$39,081.00
	Average	$21.21	$13.23	$15.68
Redwood—	Feet	.....	236,000	346,000
	Value	.....	$8,932.00	$11,081.00
	Average	.....	$37.84	$32.05
Railroad ties—	Number	.....	3,781,768	3,492,928
	Value	.....	$1,643,303.00	$1,597,894.00
	Average	.....	.43	.45
Box shooks—	Value	$10,572.00	$25,046.00	$78,779.00
Sash, doors, bl'ds—	Value	$573,875.00	$1,011,578.00	$574,823.00

Note.—The above named prices are f.o.b. cars at the port of entry from the United States and are not delivered prices into Canada.

Imports from Canada

The import of logs, lumber, lath and shingles from Canada into the United States for 1913-1914, as per classification made by the United States Department of Commerce, was as follows:—

	Duty		1913	1914
Logs and round timbers—	(Free)	Feet	130,406,000	140,641,000
		Value	$1,355,507	$1,564,572
Pulp wood—	(Free)	Cords	1,035,890	1,073,023
		Value	$6,954,939	$7,245,456
Lumber of all kinds—	(Free)	Feet	.....	617,832,000
		Value	.....	$11,768,413
	(Duty)	Feet	1,021,810,000	$275,001,000
		Value	$17,972,712	$5,168,413
Shingles—	(Free)	No.	.....	745,558,000
		Value	.....	$1,791,124
	(Duty)	No.	560,297,000	149,474,000
		Value	$1,399,751	$398,925
Lath—	(Free)	No.	.....	373,944,000
		Value	.....	$1,065,387
	(Duty)	No.	707,464,000	189,461,000
		Value	$1,895,390	$544,416

Full of Practical Things

Grand'Mere, P.Q.

Editor, Canada Lumberman:—

I congratulate you most highly on your Annual Number. It is the best thing that you have done yet, full of interest and of practical things from cover to cover, and shows us that you are keeping up with all the different branches of the lumber industry.

Yours very truly,
Ellwood Wilson,
Supt. Forestry Division,
Laurentide Company, Limited.

Filled With Instructive Matter

Campbellton, N.B.

Editor Canada Lumberman:

I have been very much interested in the annual number of The Canada Lumberman. The make-up is particularly attractive, and the issue is well filled with instructive matter.

I am sure you are to be congratulated upon such a splendid production.

Yours truly,
John M. Maclean.

Pulpwood Consumption in Canada, 1915

Canadian Pulp Mills Used 1,405,836 Cords, United States Mills, 949,714 Cords— Average Value at Mill Increaseed 10 Cents Per Cord

A report upon the consumption of wood in Canada for the manufacture of pulp during 1915, has been prepared by the Forestry Branch of the Department of the Interior and will be published in bulletin form in the near future. The report will show that since 1908, when reliable statistics were first gathered, the consumption has increased almost threefold. This increase has been extended each year with the exception of 1910, when a decrease of 3.8 per cent. was shown. The increases have varied between 10.04 and 28.9 per cent. The actual figures for the 8 years are as follows:—

1908	482,777	Cords, valued at	$2,931,653
1909	622,129	" " "	3,464,080
1910	598,487	" " "	3,585,154
1911	672,288	" " "	4,338,024
1912	866,042	" " "	5,215,582
1913	1,109,034	" " "	7,243,368
1914	1,224,376	" " "	8,089,868
1915	1,405,836	" " "	9,426,217

The Canadian pulp mills in 1915 consumed a total of 1,405,836 cords of pulpwood, valued at $9,426,217. During the same year 949,714 cords, valued at $6,164,113, were exported to the United States, making a total of 2,355,550 cords, valued at $15,590,330, as the cut of pulpwood from Canada's forests in 1915.

Although the cost of raw material has increased, and labor conditions have been disturbed by the war, the demand for pulp has increased for American consumption, and the difficulty of obtaining this commodity from Scandinavian sources has increased the overseas demand. The consumption of wood for pulp manufacture in Canada shows an increase of 14.8 per cent. in 1915. Increases are to be noted in every province in Canada, as follows: Quebec, 9.7 per cent.; Ontario,, 7.3; New Brunswick, 134.8; (bringing this province up to third on the list in place of British Columbia); British Columbia, 13.2, and Nova Scotia, 93.7.

The average value of pulpwood at the mill showed an increase of 10 cents over that of 1914. The value incerased in every province but Quebec.

Jack Pine Consumption Increasing

The report calls attention to the fact that the manufacture of sulphate, or kraft pulp, has opened a new market for the consumption of jackpine, a wood that has not been cut extensively for lumber. In 1912 only 40 cords of this wood were reported as having been used for pulp making. In 1913, when the kraft pulp was first made extensively, 19,383 cords were reported, all of which was used in the sulphate process. The increase from 1914 to 1915 was almost 70 per cent.

There was a smaller increase in the use of spruce and hemlock, and a decrease with balsam fir and poplar. While these five woods are the only ones reported, small quantities of white and red pine, and tamarack, are often used. Spruce and balsam fir pulpwood, as purchased by the mills, frequently contain a small accidental proportion of these woods, which is not reported.

The proportion of wood used in the mechanical and chemical processes of pulp making remained about the same in 1915 as in 1914. The use of wood in the chemical process increased from 36.5 per cent. in 1908, to 47.3 per cent. in 1914, and 47.1 per cent. in 1915, now forming almost half the wood consumed in the industry. The use of wood has increased in actual quantity with all four of the processes used.

Approximately 1,074,805 tons of air-dry pulp were manufactured in Canada in 1915, assuming that one cord of wood will produce one ton of ground wood pulp, or one-half ton of chemical fibre. This total is an increase of 15 per cent. over 1914. With groundwood pulp the increase was 15.3, and with chemical fibre, made by the three processes together, 14.2. The manufacture of chemical fibre by the sulphite process shows an increase of 8.2, by the sulphate process 31.4, and by the soda process 66.4.

Spruce and balsam fir are used in all five provinces and in all four processes of pulp manufacture. Hemlock was not reported from New Brunswick nor used in making soda pulp. Jackpine was reported only from Ontario and Quebec, and was used in making sulphate pulp alone. Poplar was reported from Ontario and Quebec only, and was not used in making sulphate pulp.

In 1908, the quantity of pulpwood exported in the raw state exceeded the quantity manufactured in Canada by 312,119 cords. The proportion of manufactured wood increased steadily until the two were almost equal in 1912, and in 1915 the home consumption exceeded the export by 456,122 cords. The quantity exported has increased by only 19.5 per cent. during that period, while the quantity consumed in Canadian pulp mills has increased by 191.2 per cent.

The total production of pulpwood increased in Canada by 7.2 per cent. The quantity manufactured in Canada increased by 14.8 per cent., while the quantity exported unmanufactured decreased by 2.3 per cent. Increases in proportion are to be noted in every province but Quebec; increases in manufacture in every province, and increases in export in Ontario and Nova Scotia, with decreases in Quebec and New Brunswick. No pulpwood has been exported from British Columbia since 1913.

Woodpulp

The export of woodpulp from Canada has alternately increased and decreased every year from 1909 to 1915. The total in 1915 is a decrease of 14.3 per cent. from that of 1914. The United States, France, and Japan purchased Canadian pulp in greater quantities than in the previous year, and China, Australia, Cuba, and New Zealand were added to the list, but the exports to Great Britain fell off by over ninety-eight thousand tons, bringing the total export below that of 1914.

The export of mechanical pulp decreased by 34.3 per cent., decreasing to the United States and Great Britain, and increasing to France. The export of chemical fibre showed an increase of 42.6 per cent., increasing to the United States, Great Britain, and Japan. No chemical pulp was exported to France in 1915.

The average value per ton of pulp exported increased by $4.61, increasing with ground wood and decreasing with chemical fibre.

The importation of wood pulp into Canada showed a slight decrease from 1914 to 1915. The quantity purchased from the United States increased, while that from Sweden and Great Britain decreased. No pulp was imported from Norway, Switzerland, or Austria-Hungary. The importation in 1914 of a small quantity from the latter country was stock purchased early in the year before the outbreak of the war.

Pulpwood, 1914 and 1915, by provinces: quantity used and total value, 1915; average value, 1914 and 1915:—

Pulpwood Consumption by Provinces.

Province	No. of firms reporting	Quantity 1914 Cords	Quantity 1915 Cords	Total value 1915	Average value per M. Ft. B.M. 1914	Average value per M. Ft. B.M. 1915
Canada	50	1,224,376	1,405,836	$9,426,217	$6.61	$6.71
Quebec	24	636,496	697,962	4,227,033	6.52	6.06
Ontario	15	447,751	480,627	3,806,804	7.08	7.92
New Brunswick	4	49,339	115,842	732,521	6.01	6.32
British Columbia	2	80,013	90,535	550,809	5.33	6.08
Nova Scotia	5	10,777	20,870	99,050	4.27	4.75

Pulpwood Consumption by Kinds of Wood

Pulpwood, 1914 and 1915, by kinds of wood: quantity used and total value, 1915; average value, 1914:—

Kinds of Wood	No. of firms reporting	Quantity 1914 Cords	Quantity 1915 Cords	Total value 1915	Average value per M Ft. B.M. 1914
Total	50	1,224,376	1,405,836	$9,426,217	$6.61
Spruce	50	836,387	998,156	7,057,672	6.70
Balsam Fir	33	314,183	307,219	1,785,372	6.58
Hemlock	6	45,246	55,265	325,411	5.63
Jack Pine	4	24,715	41,953	225,259	5.49
Poplar	3	3,845	3,243	22,403	6.81

Pulpwood Consumption by Processes

Pulpwood, 1914 and 1915, by processes: quantity used and total value, 1915; average value, 1914 and 1915:—

Processes	No. of firms reporting	Quantity 1914 Cords	Quantity 1915 Cords	Total value 1915	Average value per M. Ft. B.M. 1914	Average value per M. Ft. B.M. 1915
Total	50	1,224,376	1,405,836	$9,426,217	$6.61	$6.71
Mechanical	40	644,924	743,776	4,821,227	6.86	6.48
Sulphite	16	435,101	470,949	3,434,015	6.76	7.29
Sulphate	5	140,666	184,811	1,128,318	4.96	6.11
Soda	1	3,785	6,300	42,657	7.00	6.77

Exports Unmanufactured

Canadian pulpwood, exported unmanufactured vs. that manufactured in Canada, 1914 and 1915; quantity and average value per cord:—

	1914 Quantity cords	1914 Value per cord	1915 Quantity cords	1915 Value per cord
Production	2,196,884	$6.72	2,355,550	$6.62
Manufacture	1,224,376	6.60	1,405,836	6.71
Export	972,508	6.87	949,714	6.49

From the Canada Lumberman of Thirty-Five Years Ago

"Loss on Square Pine Timber."—The Commissioner of Crown Lands for Ontario in his able report for last year, says:—

The following will show the estimated loss to the Province and the revenue from waste in getting out square pine, from 1868 to 1877, both inclusive:—Total quantity taken from public and private lands during the ten years, 119,250,420 cubic feet; waste, one-fourth of each tree, equal to one-third of the total mentioned, viz.: 39,750,140 cubic feet, or say, in round numbers 477 million feet board measure, which may be valued one-half at $10 per 1,000 feet, and one-half at $5 per 1,000 feet, representing relatively the prime timber beaten off and the inferior timber from the upper part of the tree, average value, say $7.50 per 1,000 feet, equal to $3,577,500 loss to the province for ten years, or an annual loss in material wealth of $357,750.

The quantity taken from public lands during the ten years is 87,620,135 cubic feet, the waste on which on the basis given being equal to 29,206,711 cubic feet, or 350 million feet board measure, subject to Crown dues at $750 per million feet equal to $262,600 lost to the Revenue during the ten years.

The loss to the country in revenue from timber destroyed by fires which might have been confined to a limited area, and possibly extinguished, before great damage had been done to the forest, had they not been fed by the debris of trees left to rot and dry, is incalculable.

Lumbering on the Pacific Coast:—Saw-logging on the Pacific Coast is carried on somewhat differently to what it is in Muskoka. When all orders have been filled, stock lumber is cut pretty much as follows:—Butt log, 24 feet; second, 32 feet; then 40 feet, until stopped by knots. The roads are graded 16 feet, with a skid let in across the road every 8 feet. The logs are barked when the sap is up—failing this they are "rossed" on the running side. Four yoke of oxen constitute a team, the hind yoke having a tongue and dog chain. The logs are strung one behind the other, with dogs and chains; one log, however, containing 6,000 feet, being considered a load. The greaser goes ahead of the team, with a swab and can of dog fish oil, and greases the skids. With regard to the wages paid, the chopper, who stands on a spring board while working, receives $75 a month and board; hook tender, who snips the ends of the logs, drives the hooks and attends to snatch blocks and snubbing lines, gets $50; sawyer, $60; barker, $35; head skidder, $40; second skidder, $35; teamster, $75; swamper, $40; greaser (a boy), $20. All payments are made in gold. Land that has less than 200,000 feet to the acre is not considered pine land. A stock was lately cut out of a saw-log in the mill at Tacoma, which measured 34 x 14 inches, and 120 ft. long.

Ottawa.—The value of sawn lumber exported from Ottawa during the months of May, June, July, August and September, 1877, is given at $859,616; in 1878, at $686,671; in 1879 at $813,211. During the year 1880, for May, June, July and August, the value exported is $100,320. When September returns come to be added, it is expected that the increase over the five months of last year will be in the vicinity of half a million dollars.

B. C. Lumber Exhibit Installed at Montreal

In pursuance of the publicity campaign of the British Columbia Government, to push the sale of B. C. lumber in the east, the consent of the Montreal Board of Trade was obtained recently for exhibiting samples of B. C. lumber products in the principal room of that organization. The exhibits were installed under the supervision of Mr. L. B. Beale, B. C. Lumber Commissioner for Eastern Canada. Invitations were sent out to lumbermen, architects, and contractors, and these were freely responded to.

The exhibits consisted of finished specimens of seven woods—Douglas fir, Sitka spruce, Western red cedar, Western soft and white pine, Western hemlock, and Western larch, in doors, pannelling, moulding, and in fact in all the main forms of manufactured lumber. All the woods, except the doors, were arranged on large frames, the upper portions of which contained photos showing the lumber from the forest to the finished article. The photos included mills and paper and pulp plants. Underneath were printed descriptions of each wood, giving their strength values, uses, and other information. Particular interest was shown in the exhibit of B. C. pine.

Mr. Beale explained to a representative of the Canada Lumberman that the B. C. Government is anxious to impress upon the consumer the advantages of using these woods, and that the publicity campaign is a means of educating the public to specify and purchase Canadian lumber instead of the imported article, particularly Georgia pine. In creating this demand the wholesale and retail lumbermen will naturally receive a part of the benefit of the trade created. The British Columbia Government is convinced that the province can supply the lumber required in the east which now comes from foreign points, and thus at the same time develop our resources and promote inter-provincial trade. B. C. lumber has unsurpassed qualities, and there is no reason why we should purchase foreign supplies when we can obtain suitable lumber within our own borders. The publicity campaign has already resulted in a much better demand for B. C. lumber products.

The exhibit is to be a permanent one in Montreal. Later on it will be located in the Builders' Exchange. Similar exhibits are installed at Hamilton and London.

In a few days, Mr. Beale will visit the principal cities and towns in Quebec and the Maritime Provinces, in furtherance of the educational programme of the Forest Branch of the British Columbia Government.

Thirty-six Million Cords of Wood Waste Annually

There are more than 48,000 sawmills in the United States. and their output of waste in the form of sawdust, shavings, slabs, and other wood refuse, is estimated as 36 million cords per year. This is equal to over 4½ billion cubic feet of waste.

Perhaps one-half of this so-called waste product is not, strictly speaking, wasted, but serves a useful purpose as fuel under the boilers. Much of the remaining 18 million cords not only serves no useful purpose, but in most cases is a source of inconvenience and danger, and costs the mill time and money.

It is estimated that for a mill of one hundred thousand feet capacity the cost of conveying the waste from the machine where it is made and destroying it in a closed burner, is 42 cents per cord, or $10.05 per day. Burners seldom bring in any revenue, although in a few cases ashes are sold for fertilizer, and in a number of others the burner furnishes hot feed water for the boilers.

Both burners and fire-pits add to the insurance rates on lumber, and in the case of the pit, on the mill itself. In order to reduce the fire hazard to zero, in the case of the burners, it is necessary to keep all lumber piles at least one hundred and fifty feet away from the burner. The matter is much worse in the case of pits, especially the open ones. which must be kept three hundred feet away from the mill and five hundred feet away from any lumber piles. When nearer than these distances from the mill and yard respectively, the insurance rates mount up rapidly with closer proximity until they become practically prohibitive when the fire-pit is nearer than one hundred feet.

A New Lumbering Concern for Northern Ontario

Another new lumbering concern has this year been added to those so successfully operating along the line of the Temiskaming and Northern Ontario Railway, the Monteith Pulp & Timber Company, Limited. The headquarters of the company's operations are at Monteith, on the Driftwood River. about 30 miles from Cochrane, where a combination circular saw and rossing mill has been constructed and is now running, with a capacity of 35,000 feet of lumber and 100 cords of rossed pulpwood a day. The limits of the company, located along the Driftwood River and in close proximity to the mill, were first logged by the company during the past winter, and in addition they have contracted for the entire output of two sawmills and five rossing plants in the district. It is anticipated that their own output will amount to six million feet of lumber and 20,000 cords of pulpwood this season. The company's location and manufacturing conditions augur well for a most successful operation. The supply of spruce pulpwood along the Driftwood River and its tributaries is enormous, estimated at well over 1,000,000 cords. Much of this spruce is large enough to profitably cut into lumber, and as this supply is close to the mill operations of the company and practically on the line of railway, the cost of transportation is reduced to a minimum. Besides the mill buildings, the company is also operating a large general store at Monteith.

The personnel of the Monteith Pulp & Timber Co., Limited, is made up principally of lumbermen of wide experience. The officers are: James Thompson, M.P.P., Havelock, Ont., president; J. L. Squire, Norwood, Ont., vice-president; Peter Yousey, Monteith, Ont., production manager; E. R. Heyland, Toronto, secretary-treasurer. The head office of the company is at 123 Bay Street, Toronto.

A Hummer This Time

Editor, Canada Lumberman:— Glencoe, Ont.

I have received a copy of the Annual Number of the Canada Lumberman, and may say that you have gotten out a hummer this time.

Yours very truly,
B. F. Clarke.

Purchaser's Risk Upheld by Court

Let the Buyer Beware is Maxim Regulating Lumber Transaction as Court Sees It.

Judgment was recently given in the Court of Appeal in an appeal against the judgment of a county court judge in the County of Elgin, Ont., in the action of Oldrieve vs. C. G. Anderson Company, Limited. In the County Court case the plaintiff had obtained judgment in an action to recover a balance of the price of lumber sold to the defendant company. The defendant company had claimed that they purchased 28,000 feet 12/4 firsts and seconds white ash, carrying 20 per cent. No. 1 common, at $45 per thousand feet, f.o.b. cars, Dutton, inspection at shipping point, the purchase to be subject to "National inspection." The lumber was inspected at Dutton, loaded on cars, and shipped to a sub-purchaser, the Fisher Car Body Company, of Detroit, who were represented at the inspection. The defendant company contended that the shipment contained 9,920 feet more of No. 1 than the terms of the agreement obliged them to take. They also claimed a cash allowance of 2 per cent. These two claims were both dismissed by the County Court judge.

When the case came up for appeal, a majority of the Court held that the goods were in actual existence from the beginning of the negotiations and that the rule "let the purchaser beware" applied to exclude implied warranties. The inspection followed by the acceptance and shipment, settled all other questions, both of quantity and quality. The appeal was therefore dismissed with costs.

One of the judges of the Court of Appeal, however, dissented from the finding of the others, taking the position that the appellant company had not been aware of the amount or the proportion of the excess of No. 1 common, though it might be fairly said that they had known that there was some excess. They had resold, and the delivery to them was made by placing the lumber on cars. Until the loading was complete the quantity and quality, or the proportions of the latter, could not be ascertained in fact. Upon complete delivery on the cars, and then alone, could the appellant company have ascertained the proportions and known whether the contract had been observed. It would be rather a hard position in which to put a purchaser who had resold, to say that he must then and there reject and lose his resale. The respondent, moreover, had known, but had not disclosed, the true state of affairs and could not complain if required to fulfil his contract.

At the annual meeting of the Montreal branch of the Canadian Manufacturers' Association, held on June 6, Mr. William Rutherford, of William Rutherford and Sons Company, Limited, was elected vice-chairman, while Mr. J. H. A. Acer, Laurentide Co., Ltd., Mr. S. H. B. Rolland, Rolland Paper Co., Ltd., and Lieut.-Col. W. J. Sadler, Sadler and Haworth, Ltd., were elected members of the executive committee.

Something to be Proud of

Editor, Canada Lumberman:— Ludington, Mich.

I have just received a copy of your Annual Number and feel that I ought to congratulate you on the excellence of its typographical appearance as well as the merits of its contents. The trade in Canada certainly has a representative in your publication of which they may well be proud. The breadth of the editorial policy is apparent on every page, and the general readableness of the publication is in marked contrast with the average trade paper.

I cannot refrain from saying a word here in reference to the attitude of the American people toward Canada. We are proud of the Dominion, we are proud of her resources and her virility; we are proud of the part she is playing in the great war. We feel that we are the same people with common ideals and identical ambitions. The blood of Canada's sons was shed that this Union might be preserved and, to-day, not a few of the flower of our own manhood are standing shoulder to shoulder with the soldiers of the Dominion in the trenches of Europe. We have lived beside each other in peace for a hundred years because we understand each other, have the same heritage and the same destiny. It is our hope that this terrible scourge of war will soon pass away and the victories of war give place to the no less glorious victories of peace.

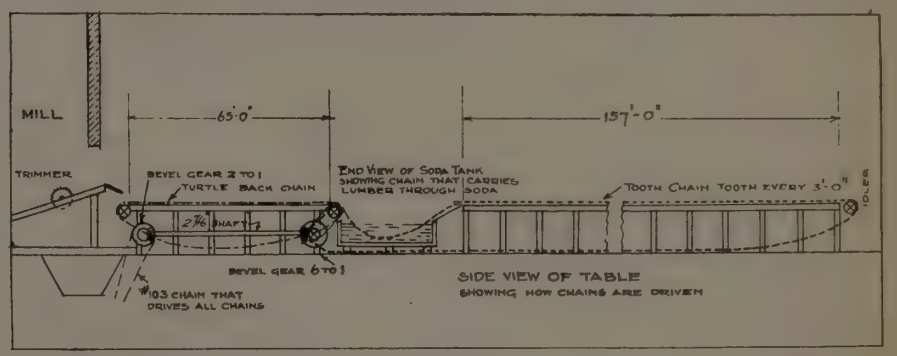
Again I congratulate you and hope that you will go on as you have begun and that the success which you certainly deserve will always be with you.

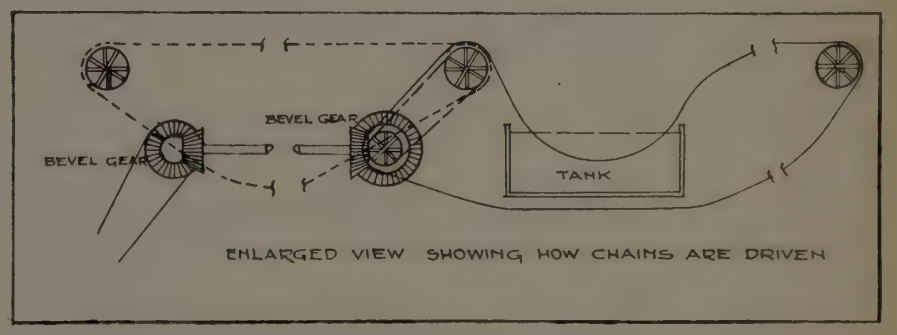
Yours very truly,
The Stearns Salt & Lumber Company,
By W. T. Culver, Vice-president.

Soda Dip for Preventing Sap Stain in Lumber

The practice of dipping lumber in a tank containing a solution of soda, in order to prevent sappy lumber from staining, is not very general in Canada, but is used in some of the larger mills. The Hope Lumber Company, Thessalon, Ont., have been using a tank of this nature for several years and report that they have obtained good results in this way. The accompanying illustration gives a clear idea of the tank and its operation. The entire length of the table shown is 229 feet. The company use both sides of the table and thus have 100 separate sortings of lumber. The tank is placed 65 feet from the mill or trimmer, which gives plenty of space for pulling off such lumber as they do not wish to put through the soda tank. From the tank to the end of the table they have 157 feet, which gives them plenty of room for the lumber that passes through the tank. In the tank they have a mixture of soda and water which kills sap in lumber. A good many mills use a sprinkling system for the same purpose, but the Hope Lumber Company find that a sprinkling system does not get at all the sap on both sides of the board, while the tank system does, as the board when leaving the table slides down the chains and is submerged in the soda.

On the mill side of the tank the chains return on drivers located at the end of the table near the edge of the tank. Underneath the table, at the mill end, there is located a bevelled gear which drives





all chains on both sides of the tank. The method of drive is shown in one of our illustrations. On the driving shaft there are five sprockets just outside of the tank on the mill side. Two of them are idlers and the other three are drivers, one of them driving all the chains from a shaft under a table. The chains on the sorting side of the tank run through the soda, along the sorting table and return under the tank and table being driven by a driving sprocket at the mill side of the tank.

The tank is built of 12/4 in. Norway. It is 26 ft. long, 7 ft. 6 ins. wide and 16 ins. deep. The table on each side of the tank is 9 ft. wide.

The Quebec Government was represented at the recent Lyons fair of samples, at Lyons, France. The exhibit included specimens of lumber mounted on a large stand, together with samples of pulp. The Riordon Pulp and Paper Company, Ltd., Montreal, showed samples of their sulphite pulp, while the Canadian Boomer and Boschert Press Company, Limited, Montreal, had on view photographs of their productions. The British Columbia Government also sent a large number of photos showing standing timber.

"The Finest I Have Ever Seen"

Editor, Canada Lumberman:— Parrsboro, N.S.

I have received a copy of your splendid Annual Number. It is, I think, the finest of any I have seen, and would be highly creditable to any printing office, of any city. I am proud to know that Canada can turn out such an excellent trade journal.

Yours very truly,
E. Woodworth.

Early Days in New Brunswick Logging

Interesting Reminiscences of the Beginnings of a Great Industry—By One Who Lived Through Much of Them*

In August, 1840, when I was little more than eleven years old, I began my career in lumbering. With seven men—five of whom had blackened eyes, evidence of the rum-drinking and fighting commonly indulged in by the Irish, Scotch, and English along the river at this time—I set out for my father's camp on the Miramichi Road, six miles up the Shiktehawk River, about ten miles from my home in Greenfield. I rode a black horse with which we "snaked" our two canoes around the rocks where the current was swift, and twice swam across intersecting streams, clinging to the hames of my mount.

At the camp were fifteen men, with fourteen horses, felling the trees, hewing them into ton timber and piling them on rollways on the banks of the river, whence they were floated down the St. John for the export trade. In accordance with the system of the time Sherman Tapley, an associate of Squire Nevers, as the "supply man," advanced the equipment and provisions for the camp. My father as contractor had full charge of, and was responsible for, the operations carried on.

The winter in 1840 and 1841 was unusually rigorous. The snow was seven feet deep, and whether for this or some other reason the country was overrun with a horde of wolves which, it was supposed, had migrated from the ice-bound wilderness to the north, in search of food. At the camp they did not molest us, but they invaded the sheep folds at the farms in packs and slaughtered the unfortunate animals by the scores. Some of the poorer families, for lack of secure stables, were obliged to take their small flocks into their houses at night for safe keeping.

Work at the camp moved according to a well-measured routine. The men arose shortly before daybreak and went to work in the woods on snowshoes, beginning as soon as the light was sufficient to enable them to see clearly. Except for the brief interval of rest at midday for dinner, which I brought to them, they kept at it steadily until nightfall, when they returned to camp. Being too tired for diversion, as a rule, they went to bed shortly after supper. So life moved for them day after day until the approach of spring unlocked the fast-frozen streams, and the timber was floated down to market. The only respite from labor was afforded by Sunday, and on that day axes were ground, repairs made, and the camp set in order for operations during the week.

To me was assigned the duty of cooking. Although not very proficient, I managed well enough, as our fare was limited to pork, beans, bread, molasses, tea, and dried apples—not a well diversified diet, but as good as could be obtained under the circumstances. The men were satisfied mainly, perhaps because the time did not afford a higher standard by which they might measure the shortcomings of their own lot. Nor did their health suffer for lack of luxuries, edible or otherwise. Sickness was rare. In my long experience in the woods in New Brunswick, in Maine, and in later years in Wisconsin and Michigan, I discovered that ordinary ailments and diseases were phenomena of community life and that their prevalence was largely in proportion to the complexities of the modern way of living. In the isolated camps in the pine forests they had no place.

Logging and timber making, of course, had its dangers. During this same winter one of the men of our camp, Kinney Landers, was killed, and another, named Hoyt, was injured while breaking out a rollway. Both men, citizens of the United States, were pinned under the rolling logs, and Landers was crushed to death. For the funeral, I remember, the activities of the camp were suspended for three or four days, when time was most valuable. There were also many cuts and gashes due to slipping of axes on the frozen timber, but infection of the wounds was extremely rare—I do not remember a case of what has been called blood-poisoning—and recovery rapid.

The Lot of the Logging Contractor

Most of the lumbering at this time was done by men who, like my father, contracted to fell the trees and hew the logs into square timber. Capital was scarce and the contractors generally were obliged to obtain their supplies on credit, a condition that was unfortunate, for those capitalists, in many instances, took avery advantage of the debtors' laws to acquire possession of the fruits of the labor of the men who suffered hardship and privation in the forest, and upon whom the burden of production rested most heavily. When the timber had been cut the creditors, under cover of the drastic law, swooped down upon the contractors and seized it for debt before it could be delivered. The contractor himself was thrown into a debtor's cell. Some of the largest lumbering firms in Canada resorted to this practice, which became a positive evil, and hundreds of the most efficient lumbermen in New Brunswick, to escape the sheriff, fled across the border and took refuge in Maine, where they contributed much to the prosperity and upbuilding of the country.

In the winter of 1840 and 1841 one Purdy, of the firm of Purdy and Dibble, storekeepers, arrived at our camp with a deputy sheriff of the county, named Craven, on their way to arrest William Rogers, a neighboring contractor, and to seize his timber and equipment for debt. My father's sympathies were naturally with Rogers and, while acting as host to Craven and Purdy, who remained over night, he sent a boy, William Coulter, out surreptitiously to warn him of their coming. Rogers entrenched himself behind natural barriers by driving his horses up the byroads and blocking the main thoroughfare by felling trees across it. When Craven and Purdy arrived at his camp on foot they found it deserted and returned home without accomplishing their purpose. Before they could renew their attempt Rogers succeeded in making arrangements to tide himself over the difficulty.

According to the methods of logging which prevailed in Maine, when a tree was felled a pathway was cleared through the deep snow to the main road and the log, with one end chained to a sled, was dragged from the stump. The hauling was done by teams of three yoke of oxen, the driving of which was one of the most difficult and remunerative accomplishments of the lumbering craft. Ox teamsters, who were looked upon as persons of a higher category by the swampers and axemen, were paid, in some cases, as much as sixty dollars a month, while the foreman of the camp received only twenty-six to thirty dollars, and their wages were little short of munificent according to the scale then maintained.

The use of oxen in logging can be traced back directly to the period before the American Revolution when the English and French governments began to draw upon the forests of Maine and New Brunswick for white pine for masts and spars. Only the oxen trained for that purpose, with their slow, steady pull, were strong enough to drag the huge trunks, some of them more than three feet in diameter and a hundred feet in length, out of the woods. In 1815 and later it was the practice in Maine to drive them even singly in hauling timber to the rivers. In my father's camps I set out to master the art, for such it was, learning not only to drive the oxen, but to train them. This latter task required about two months for a team of six and could be accomplished at all only by the exercise of the greatest patience and forbearance. The animals were driven with a goad stick, about four feet long, five eighths of an inch thick at the large end and a half-inch at the smaller, with a brad about a half-inch in length. Outside of Maine and New Brunswick whips were commonly used.

Rivalry Among River Drivers

The rivalry among the drivers in the Maine forests, of whom there were hundreds, perhaps thousands, was extraordinarily keen. Contests in hauling trees or starting boats laden with stone held as important a place in the diversions of the day as the more athletic sports or races of the present. Fortunately, I made the most of my opportunity. The knowledge I acquired stood me in good stead in after years, when we did most of the masting on the upper lakes. At Escanaba, Michigan, sixty-five years ago, I ranked among the best drivers; and I took, and still take, a great deal of pride in that accomplishment.

In 1844 I went down the Fish River and the St. John on the

Annual Number Much Appreciated

Glens Falls, N.Y.

Editor Canada Lumberman:

I have looked over your annual number with much interest and wish to congratulate you upon the interesting and very practical articles which it contains. The article on pages 92 and 93, "Hire and Fire vs. Hire and Inspire," is especially worthy of praise. I was also much interested in the articles regarding old and new lumbering methods and sawmill equipment in eastern Canada. The article by Ellwood Wilson, regarding the careful study of timber lands made by the Laurentide Company, could be read with profit by holders of timber land from all sections.

Yours very truly,

H. Lincoln Churchill,

Forester, Finch Pruyn & Company, Inc.

first log drive of large proportions in those waters. Before this time timber and logs were brought down from the upper river loose in small quantities to a point below Grand Falls, where they were gathered together into small rafts. These were poled as far as Spring Hill, at the head of tidewater, made into larger rafts, and floated down with the tide to St. John.

The Yankee lumbermen first adopted the practice of bringing the timber down the rivers loose in large quantities and established the methods of log driving which were followed in the west. Here again I was to profit by my experience. The lessons I learned from Jefferson Sinclair, who built the boom at Oldtown and superintended this first great drive down the St. John, I applied to great advantage on the Menominee River, which came to be as important in the fifties and later, as the Penobscot had been before, and produced hundreds of millions of feet of timber every year.

On the St. John drive there were two crews, each consisting of one hundred men, one under the direction of George Lincoln, the other under Henry Colton. My function was to serve as "cookee," or assistant to the cook, in which capacity I accompanied Colton's crew. The position was not so difficult as might be supposed. The cook, a personage of some importance in the environment in which he moved, was not merely my superior, but a very good friend. For three months, or until the drive was completed, we tented together, and during our leisure moments I taught him to read and write, while he taught me French. Colton, who afterwards went to Pennsylvania, where he had charge of the boom at Williamsport, also took me under his special protection and asked me to come and live with him. We constituted, if not a picturesque, at least a very congenial trio.

The course of the drive was through Portage, Eagle, and Long Lakes to the north of Fish River, and thence down the St. John. In the hazards encountered—the breaking of jams and the passage of dangerous rapids—I, of course, did not share. None the less the journey was eventful. The timber was to have been collected at Glazier's boom, seven miles below Fredericton, and rafted the remainder of the distance; but the boom proved unequal to the strain put upon it and broke, and we were compelled to continue our operations down to St. John.

This enabled me to secure my first glimpse of a city and the vessels at anchor in the harbor. It was taken, however, under the protection of some of the members of the crew, as the belligerent Irish boys around the wharves were only too glad of an opportunity to war upon an unsuspecting lad from the country, who undoubtedly indicated by his actions that the environment was a novel one. It was July by the time we returned to Aroostook.

Hugh Munro Again in Harness

The Canada Lumberman is pleased to announce that Mr. Hugh Munro, whose health failed him some months ago, is gradually recovering his old-time vigor and looking fit again. He has severed his connection with the Oliver Lumber Company and is making arrangements to start in business on his own account, under the name of the Hugh Munro Lumber Company, Limited. Few lumbermen are more widely known than "Hugh" Munro—and few have more friends in the trade. He was associated for many years with the old firm of Donogh & Oliver, while latterly being a stockholder in the Oliver Lumber Company. An extensive experience in the buying and selling of lumber, coupled with a natural disposition to study the requirements of the consumer, has brought to him a very thorough knowledge of the lumber business, and his entry into the wholesale lumber field, by himself as it were, will doubtless mean further success.

B. C. Scaling Report for April

The timber returns for the month of April, issued by the Minister of Lands for British Columbia, shows that the total scale of saw-logs for the province amounted to 55,061,261 feet board measure, in addition to 309,678 lineal feet of piles and poles, and 21,990 cords of ties, shingle bolts, etc.

The saw-logs scaled in the various districts include Vancouver, 37,613,742 feet; Island, 9,804,994 feet; Cranbrook, 4,491,277 feet; Vernon, 1,001,378 feet; Nelson, 988,604 feet; and Prince Rupert, 620,711 feet.

In the Vancouver district there were scaled 117,945 lineal feet of poles and piles, Island district 58,937 lin. ft., Prince Rupert 42,680 lin. ft., Kamloops 36,974 lin. ft., and Nelson 32,077 lin. ft.

Timber sales recorded during April cover an estimated total of 2,234,000 ft. B.M. sawlogs, to produce a revenue of $3,927.

Robert K. Anderson, widely known through New Brunswick as a successful lumberman, died at his home, Lawrence Station, recently, after a lengthy illness. The late Mr. Anderson was 68 years of age and is survived by his widow and four sons.

Newfoundland Industries Growing

Important Company Started to Develop Pulp, Lumber, etc.—Barrel Industry Developing.

St. Johns, Nfld., June 5; (Special to the Canada Lumberman):—The Newfoundland Products Corporation, which was incorporated during the last session of the Legislature, has obtained large and important concessions from the Government. The company will establish an extensive industry for the manufacture, among other things, of pulp and lumber, and a fertilizer known as amonium sulphate. Several plants are to be erected, at a cost of $18,000,000. The necessary capital has been obtained, we are informed, from the banking firm of Stone & Heyden, New York. When incorporated, the company included Messrs. Thos. L. Wilson, of Woodstock, Ont., and the Reid Newfoundland Company of Newfoundland. Mr. Wilson, well known for his carbide industry, has since died, and the Reid Newfoundland Company are now the chief promoters. The Reid Company have included in the new company a large portion of their timber limits. These are among the most important and best watered in the country. More than one million dollars has already been spent upon the preliminary work since last spring, chiefly in surveying the holdings. Construction work will probably be commenced this summer. The company will put up two sawmills at a cost of $211,800. Sulphite pulp mills, electrolytic bleaching plants and wood preparation equipment will be installed at a cost of $1,568,300. The sulphite pulp mills will consume 100,000 cords of spruce pulpwood yearly and will produce 36,500 tons of sulphite pulp, valued at $1,825,000. The company have acquired for a period of 99 years the entire water power on the Humber River (the largest river in Newfoundland), and on Junction Brook, together with numerous water powers on the Hamilton River, Labrador. They have agreed to sell any amount of water power up to 500,000 h.p. to any saw or pulp mills operating in their vicinities. The survey work is being carried on by Messrs. Jos. Wallace & Sons, New York.

The barrel making industry is developing to considerable proportions in Newfoundland, to meet the demands for packing herring for the American markets. Newfoundland firms are going in extensively for the herring trade. Last winter the herring pack for export amounted to 85,660 barrels. The spring fishery is expected to have an even larger output. The only hardwood available in the country is birch, and it is only in limited quantities. Staves for this industry will have to be imported from Canada.

W. E. B. Wally, a well-known English timber expert, visited Bonne Bay, on the West Coast, recently, to look over timber areas for English capitalists, who are thinking of purchasing from the present owners, Messrs. Salter & Sons, of Nova Scotia. Mr. Wally was favorably impressed with the property and it is probable that a sale will result at a substantial figure.

The shortage of tonnage for trans-Atlantic shipment is affecting the export of pit-props to England. About 300,000 cords of pit-props and a quantity of pit wood are lying upon the banks around the coast waiting to be shipped. Eight large cargoes have already been shipped this season, but the quantity remaining is many times greater than that which has been shipped. Unless sufficient steamers are obtained, it is likely that there will be a considerable loss to those engaged in the work. A number of old wooden sealing vessels have been pressed into this service.

Mr, George Esplin, who died at Lachine, P. Q., on May 28, aged 70, was senior member of the firm of G. and J. Esplin, box manufacturers, Duke Street, Montreal. Mr. Esplin had been ill for some time, and recently had attended to his business only at intervals. He took a deep interest in educational and hospital work, being chairman of the Lachine School Board and governor of three or four hospitals. The firm is one of the largest box manufacturers in Montreal.

Setting a High Standard

Editor, Canada Lumberman:— Toronto, Ont.

The copy of the Annual Number of your paper has been gone over carefully in our office, and we wish to compliment you and your editor on the high standard you have set in this copy. There is more interesting and useful information in this copy than we have seen in any of the lumber trade journals for some time. We think that you have taken up a line of articles that must interest anyone who is systematic in his handling of lumber situations.

Hoping that you may have more of these articles, we are,

Yours truly,

Edward Clark & Sons,

Per A. E. Clark.

The Preservative Treatment of Timber

By W. G. Mitchell*

A large proportion of timber used for industrial purposes is required for service under conditions which are favorable for deterioration from decay and insect attack. These conditions vary widely, and similarly, the means which may be adopted for the reduction of losses from such causes are determined largely by the nature of the service for which timber is used. The artificial preservation of timber is not a new practice, but recent years have developed many improvements in methods and accumulated a varied and extensive experience which has yielded much definite knowledge regarding its possibilities. It is impossible to estimate even approximately the actual value of timber annually destroyed in Canada by the agencies above noted, but the situation is certainly serious enough to warrant very careful consideration of any means for preventing or reducing such losses.

The Natural Durability of Wood

Woods of various species differ greatly in their natural resistance to decay. The cedars, oaks and Douglas fir are among the most durable of Canadian commercial woods, while ranging below these in an estimated classification on a basis of natural durability are the tamaracks, the hemlocks, the pines, the spruces and such hardwoods as beech, birch and maple. Variations in this respect apply to the separate species of above woods. Thus, white oak is by far the most durable of all the oaks, and black spruce is regarded as more durable than the other Eastern spruces,—red and white. The striking difference in resistance to decay between heartwood and sapwood of practically all species is, of course, a matter of common knowledge among timber users.

* Chief of Division of Wood Preservation, Forest Products Laboratories of Canada.

Insect Destruction of Timber

The destruction of structural timber by insects is not so serious in Canada as in Southern climates, but the damage from this cause is very considerable. This statement applies to insect destruction of rough or finished timber and does not refer to damage caused to living trees by forest insect pests.

Among the insects which attack structural timber those which are most destructive in Canada are the borers (round-headed and flat-headed), powder-post beetles and ambrosia beetles. In general, unbarked timber is more liable to insect attack because of the fact that the eggs are deposited within the bark during the early summer months and rapidly develop into mature insects. Winter cutting, peeling and effective methods of seasoning will do much towards the reduction of damage from insects. A feature of the action of wood boring insects which ordinarily receives little consideration is the fact that the burrows of such insects offer favorable points for the development of fungus plants. The usual methods of preservative treatment adopted for protection against decay are also very effective in preventing insect destruction.

The marine boring insects which infest ocean waters and cause enormous destruction of piling, dock and bridge timbers, more particularly in Southern climates, appear both in the Atlantic and Pacific

Canadian coast waters, although they are rather less destructive in northern latitudes.

Principles of Wood Preservation

The decay of wood is possible only under certain conditions of temperature, moisture and air supply. If these requisite conditions are lacking, seasoned wood requires no further protection against decay. Thus, wood for interior finishing and structural timber in dry buildings, furniture and the innumerable wooden articles in common use do not deteriorate from this cause. In general, timber which is exposed to the weather, particularly if in contact with the ground, and that used in mining operations and in damp buildings is subject to decay to a greater or less extent. In such cases the service life may be very materially increased by artificial protective treatment.

The basis of those methods of wood preservation which are most effective and in most general use is the treatment with a substance which has a positive toxic action toward fungi. Other methods which have been proposed and adopted to some extent depend on the partial waterproofing of timber either by superficial application of paints, pitch or similar materials, or by impregnation with such relatively non-toxic oils as crude petroleum. These latter methods have serious limitations for many practical requirements and are not in general use. Painting of sound seasoned lumber or heavier timber exposed to the weather affords considerable protection against decay under certain conditions. However, superficial application of, or partial or complete impregnation with an antiseptic material is the only effective method for the preservative treatment of that large proportion of timber used under service conditions in which painting could give no lasting protection.

The development of wood preservation in Canada has been comparatively recent and is not yet very extensive. There are now five plants in Canada equipped for pressure treatment of timber, all established within the past decade. A sixth plant of this class is now in course of construction on the Pacific coast. There are a few smaller installations adapted to non-pressure treatment of small material.

Preservatives

Among the preservative materials which now have considerable application in timber treatment, tar products of various grades,—commercial creosotes, mixed paving oils and special high grade distillates,

Longitudinal section of creosoted birch railway tie, showing penetration of preservative with complete impregnation of outer wood.

are most extensively used. Such oils have a relatively high toxicity to fungi and wood destroying insects, have a considerable waterproofing value which is an important factor in certain cases, and are comparatively permanent as regards protective action. Of the metallic salts used as wood preservatives, that which is most widely in use at present is zinc chloride. Other preservatives of this class, which have a limited use in America and a more general application in European wood preservation practice, are mercuric chloride, sodium flouride and copper sulphate. A few additional inorganic salts are used for wood preservation but are of minor importance.

In general, creosote is adapted to any method of application, from brushing to full pressure treatment. It is used practically exclusively for treatment of piling and paving blocks and very largely for treatment of ties, poles, posts and other timber placed in damp places or in contact with the ground. In the United States in 1914 the consumption of commercial creosotes for wood preservation, including mixed paving oils, was approximately 90,000,000 U. S. gallons, a figure which, because of reduction of European exports, was less than that of 1912 by 18,000,000 U. S. gallons. Canadian consumption during 1914 was approximately 3,500,000 Imperial gallons.

Zinc chloride has had a long and successful application as a wood preservative. It is used largely for treatment of cross ties and miscellaneous construction timber. As in the case of all metallic salt preservatives, it is applied in water solution, and is used in pressure methods of treatment most widely. Because of the solubility of this salt, the protective value may be reduced by leaching where timber treated by this method is exposed to excessive moisture. This is a limitation which prevents its use for certain conditions, although it is probable that this is less serious than is generally supposed. In 1914 the consumption of zinc chloride for preservative purposes in the United States was over 27,000,000 pounds. It has had only a very limited use in Canada but will no doubt be more widely adopted in this country as wood preservation practice develops.

Mercuric chloride has had a fairly wide application as a wood preservative in Europe and is still in general use on the Continent. It is one of the most toxic materials which have been used for timber treatment, but it has one limitation which has prevented its very extensive adoption in American practice. It is exceedingly corrosive and therefore cannot be used for pressure methods of treatment in steel retorts. The use of this material as a wood preservative in America is rather limited and is confined to open tank treatment of lumber and other forms of building timber. Where used in this way, timber is soaked for some days in hot or cold solutions of the salt, varying in concentration from ¾ per cent. to 1 per cent. Mercuric

One of the pressure retorts in experimental wood preservation laboratory, Forest Products Laboratories of Canada.

chloride is exceedingly poisonous, but is not objectionable in handling if proper precautions are taken.

Sodium fluoride is one of the more recently developed preservatives, which has given good results. It has a longer record of use in Europe than in America, although it has been adopted in the United States during the past four years, and the results have been sufficiently encouraging to warrant a considerable increase in its use. It is highly toxic, is quite suitable for use in steel retorts and has other derisable characteristics as a wood preservative.

Methods of Applying Preservatives

Methods of applying preservatives may be classified as non-pressure and pressure methods. The former include brushing and dipping or prolonged immersion in the preservative. In brush application creosote is used most largely. This method is adapted for the superficial treatment of poles, posts and miscellaneous lumber. One or more coats are applied as may be required. Timber must be dry, peeled and clean for successful results from this method. Preservatives should preferably be applied hot where possible. Application can be only superficial at best and protective value of such treatment is limited accordingly, but the method has certain fields of use where more expensive treatment would not be justified.

Dipping, as distinguished from long immersion, when adopted, is generally used with creosote, although water soluble salts may be applied by this method. Dipping of freshly sawn lumber to prevent sap staining in hot damp weather is a case of this latter practice, where a solution of sodium bicarbonate, sodium fluoride or more rarely mercuric chloride is the preservative used. Preservative may be hot or cold, preferably hot in case of creosote oil. Dipping affords rather more effective protection than brush treatment with similar preservative. Fence posts, tank and silo staves and other light structural material may be treated by dipping method.

Prolonged immersion in preservative is exemplified by the mercuric chloride treatment of structural material. In this case it is customary to soak the timber in open tanks containing a solution of the preservative for a period of from two to eight days, according to size of material. The preservative may be heated by direct steam if desired and a 1 per cent. concentration is the usual strength of solution. Timber for such treatment must be well seasoned and should be allowed to dry after immersion.

Open tank treatment is the name applied to a method in quite general use for treating poles, posts, cross arms and miscellaneous lumber. The principle of the method is a first heating of timber in hot preservative followed by cold immersion or slow cooling in first preservative. The air contained within the wood structure is partially expelled on first heating and contracts on later cooling and the consequent reduced pressure within the wood results in considerable absorption of preservative. This method gives much greater penetration than mere dipping treatments, requires only simple and inexpensive open tank equipment and is well adapted for use on a comparatively small scale. Creosote is generally used with this method although it is equally well suited for treatment with water soluble preservatives.

Pressure methods are extensively used in large scale timber treating operations. Pressure impregnation is applicable to all oil preservatives and to those salt solutions which have not a serious corrosive action on steel retorts. A large horizontal steel cylinder or retort is used almost exclusively for pressure treatment. In present commercial practice such cylinders range in length from 50 ft. to 130 ft., while diameters vary from 6 ft. to 8 ft. In most modern plants of large capacity, cylinders of the maximum sizes above noted are used. The equipment of a modern plant of this type is quite extensive and will include one or more treating cylinders, storage tanks, measuring tanks, high pressure hydraulic pumps, vacuum pumps and steam power installation. Pressure cylinders are designed for pressures up to 250 pounds per square inch, although working pressures during operation usually range from 125-175 pounds per square inch. Quite recently a type of vertical retort has been developed in the United States for the treatment of paving blocks. Such retorts are of various sizes ranging in diameter from 11-20 feet and in height from 14-30 feet. In one type, blocks are discharged through bottom hoppers, while a feature of another type is a movable ram which forces blocks out at the top of retort.

There are a number of modifications of pressure methods of timber treating in use in present practice. The name of the original pressure treatment—"Bethellizing,"—is still current, and as now understood refers to straight pressure treatment with creosote oil. Injection of creosote may be preceded by artificial seasoning by steaming and exhaustion of retort, where green or partially seasoned timber is being treated. This method is in general use for treatment of piling, ties, and pacing blocks. Burnettizing is the name now applied to the corresponding method of treatment with zinc chloride solution.

The other more important modifications of pressure methods are the Lowry process, Rueping process, combination treatment known as Rutgers process in Europe or Card process in America, and boiling methods known under several names.

Preparation for Preservative Treatment

Wet or green timber cannot be satisfactorily impregnated with preservative, and seasoning or drying is an essential prerequisite for successful treatment. Ordinarily this is accomplished by natural air seasoning, for periods varying with size of material, season of cutting and climatic conditions. The greater proportion of timber intended for preservative treatment is more or less completely air dried. Air seasoned timber will contain from 12 to 18 per cent. of moisture, based on dry weight. Kiln drying of lumber is common practice, but structural timber for preservative treatment is rarely, if ever, dried by such a comparatively expensive method. However, artificial seasoning of green or partially seasoned material is practiced extensively in modern timber treating practice. In many cases such material is subected to a preliminary direct low pressure steaming in retort for varying periods, followed by a vacuum for the purpose of increasing evaporation of water. Such preparatory treatment is followed by application of preservative under pressure. This method is widely used in the pressure treatment of ties, paving blocks, piling and heavy structural timber. Another method of artificial seasoning which has been developed for the treatment of timbers which are resistant to impregnation, particularly when air seasoned, is long continued heating of timber in creosote oil raised to temperatures above the boiling point of water. This method, which is a feature of several processes, is employed quite extensively for the treatment of Douglas fir.

Barking or peeling of timber is another essential preparation for preservative treatment. This applies, of course, to timber in the round form as in the case of piling, poles, and mine timbers. Bark adhering to timber may entirely prevent local penetration or preservative. Another consideration, as previously noted, is that peeled timber is much less susceptible to the attacks of boring insects during the period of seasoning. Peeling timber greatly hastens drying and thus reduces the seasoning period before treatment. In some cases peeling may be delayed until immediately before treatment. This practice has been adopted with seasoned pole ties of certain species, in which it has been found that more thorough penetration with preservative is thus possible.

Commercial Forms of Timber Adaptable to Preservative Treatment

A partial classification of those commercial forms of timber which are ordinarily subject to deterioration from these causes includes railway cross-ties; pilings; dock, trestle and bridge timber; mine timber; telegraph, telephone and transmission line poles; fence posts; wood paving blocks; structural timber, flooring and roof planks in certain classes of industrial buildings; shingles; silo and tank staves; lumber for similar miscellaneous uses; cross arms; insulator pins and tie plugs.

Railway Cross Ties

The preservative treatment of railway ties in Canada is only of recent development. In 1910 the number of treated ties used by Canadian railroads was negligible. In 1913, of a total of approximately 20,000,000 ties used, 10 per cent. were reported as having received preservative treatment, while in 1914 this proportion decreased to less than 7½ per cent.

A considerable proportion of treated ties used in Canada in these years were imported from the United States. The more important treatable tie woods of Canada are Jack pine, Eastern and Western hemlock, Douglas fir, Western larch, tamarack, beech, birch and maple.

The cost of tie treatment varies widely according to preservative used, absorption specified and operating conditions. In present American practice cost of creosote treatment ranges from 25c to 40c per tie. A typical cost for treatment involving a fairly heavy absorption (20 pounds per tie) in 35c. Burnettizing ranges from 10c to 15c per tie for absorption equivalent to injection of from 1/3 to 1/2 pound dry zinc chloride per cubic foot of timber. Treatment by the Card combination costs from 15c to 20c per tie.

Piling

Thorough creosote treatment of piling exposed to action of marine borers is the best method of protecting such timber. Pressure treatment of the entire pile is practised almost exclusively in America. In general, those woods which are easily impregnated are most suitable, assuming requisite strength characteristics. Absorption of preservative up to 22 pounds per cubic foot are specified for piling treatment. Practical results and experimental research have indicated the necessity for careful specifications of the composition of creosote oil for this purpose, to insure a permanent and sufficiently toxic preservative. Douglas fir is the Canadian species used most extensively as creosoted piling. Piling used in fresh waters and subject to decay only may be protected by lighter treatments than above described. In some such cases partial pressure treatment of that part of the

timber most subject to decay is adopted. This is accomplished in vertical retorts large enough to receive the entire timber in which preservative to required depth is admitted and forced into wood under pneumatic pressure.

Lumber and Structural Timber for Industrial Buildings

There are many classes of industrial buildings in which slow burning timber construction is economical practice. In many such buildings, as in paper mills, textile mills and tanneries, the nature of the operation is such that conditions are very favorable for wood decay. In such cases preservative treatment offers a means of using this economical type of construction with greatly reduced danger of deterioration from this cause. Such heavy structural members as floor beams and columns may be subject to serious decay if unprotected by such treatment. The planking of laminated floors, a widely adopted type of floor construction, is particularly susceptible to decay under certain conditions and roofing planks also suffer heavily in this respect. In many cases decay of such building timber is a result of former infection during storage or handling prior to use. Precautions in these matters are first requisites for satisfactory results. The creosote treatment of such timber is subject to some objection because of odor or increased fire hazard, although these considerations are really not as serious as is generally supposed. However, metallic salt preservatives are preferred in current practice and very satisfactory results are obtained from such treatment. Mercuric chloride has been used most widely in America for such purposes. Open tank immersion of timber in cold solution is the usual method. Sodium fluoride seems to offer good possibilities for use in this field of preservation, although it has apparently not yet been adopted to any extent for this particular purpose. It is of great importance to use only timber which is perfectly sound and well seasoned in such building construction. Cases have been noted where timber has been quite seriously decayed before being used and results cannot be satisfactory under such conditions. Costs of mercuric chloride treatment normally range from $2 to $5 per thousand board feet, according to size of material.

Paving Blocks

Wood block paving has had a most rapid and successful development both in Europe and America, since pressure methods of creosoting wood have been extensively adopted. Untreated wood paving, known quite widely in America a generation ago, was non-durable and unsatisfactory in other respects. Modern creosoted wood block paving has been proved to be a type of street surface well adapted to requirements of city traffic.

Creosote is the preservative used almost exclusively for paving block treatment and pressure impregnation has entirely superseded former dipping methods. Paving blocks require fairly heavy absorption of creosote oil for successful results. The waterproofing value of the treatment is of considerable importance as well as the preservative effect. Creosote oils used commercially for paving block treatment are frequently of lower grade than those required for other purposes in preservation. Careful attention to methods of treatment is necessary for satisfactory results. Modern paving blocks for treatment are rectangular in section, varying in depth from 3 ins. to 5 ins., parallel to grain, from 3 to 4 inches wide and 5 to 10 inches long. Treatment specifications require absorption ranging from 14 to 20 pounds per cubic foot. Costs of creosoted blocks vary from $1.25 to $1.90 per square yard, according to depth of block and absorption of oil. Costs of completed wood block pavements range from $2.50 to $3.80 per square yard, including foundation, excavation and laying.

The foregoing cases are typical of a few of the more important possible applications of wood preservation, but do not include all of the various commercial forms of timber to which preservative treatment may be applied with advantage.

The Forest Products Laboratories of Canada, Montreal, include in their organization for experimental investigation of problems relating to the industrial utilization of wood, a Division of Wood Preservation, which is devoted largely to experimental work in that particular field. Complete small scale equipment has been installed in the experimental wood preserving plant of that department. This equipment has a wide range of operation and is adapted for the treatment of timber up to standard railway cross tie size. The larger of two pressure retorts is a horizontal cylinder, 2 feet in diameter and 10 feet long, designed for pressures up to 250 pounds per square inch. A laboratory equipped for the analysis of preservative materials and a pathological laboratory are features of this department. Pathological work includes the study of growth conditions and destructive action of wood destroying fungi, determination of protective value of preservative materials, and investigations of natural durability of various commercial wood species as indicated by results of accelerated tests.

Opportunities for Wood Preservation in Canada

Although there has been some growth of the wood preserving industry in Canada during the past five years, its present development is far from corresponding with Canadian timber production and domestic consumption.

One of the largest fields for wood preservation in this country is in railway cross ties. Our domestic supply of the more durable hardwoods for this service is limited. With a few exceptions the softwoods available are relatively non-durable in tie service conditions and offer attractive opportunities for economy by preservative treatment. The railway mileage of Canada is relatively great and total annual timber consumption for tie requirements is large. Wood preservation offers one means of reducing these annual requirements.

Poles for transmission, telephone and telegraph lines are required in annually increasing numbers. Already cedar poles of required sizes are difficult to obtain in many localities. Not only may preservative treatment be applied with advantage to cedar poles, but such treatment makes possible the economical use of less durable timbers for this purpose.

Wood block paving for city streets, bridges and industrial building floors is growing in favor. Some Canadian softwoods are well adapted for this use and an immediate development of this field of wood preservation may be expected. Structural timber for industrial buildings should, as far as possible, be insured against decay by careful selection and handling and, where necessary, by suitable preservative treatment. Consumption of timber in the mining industry is very considerable and rate of consumption is increasing in some districts. Although a part of this timber is of comparatively low grade, there is little doubt but that wood preservation affords a means of obtaining longer life and ultimately cheaper service from a substantial proportion of timber used in mining operations. Marine piling and dock timber may almost invariably be treated with advantage. Trestle and bridge timber forms another large commercial class of material to which preservative treatment may be applied with economy. Wherever decay may seriously limit the service life of timber the possibilities of wood preservation should be considered.

From the viewpoint of the timber consumer, the immediate or ultimate economies which may be realized from the practice of wood preservation are the most material considerations. From the viewpoint of the timber producer, the possibilities of preservation are of even wider interest. Preservative treatment permits the more efficient use of this product for many purposes, and is thus one of the most important factors which will enable structural timber to hold its present fields of industrial application and to extend its commercial uses, in the face of increasingly keen competition from other structural materials. The producer has a direct and material interest in the promotion of intelligent and economical practice in the use of timber for all purposes for which it is fairly adapted. From the viewpoint of conservation of forest resources, which in its true sense implies economical utilization, wood preservation is of special significance. Not only does it offer large possibilities of direct economy in timber consumption, but it makes possible the use of many relatively inferior or non-durable wood species for purposes for which they could not otherwise be available. Canadian timber resources are reasonably large but it must be realized that there are some limits in a variety of the more durable commercial species, which limitations may be supplied in part at least, by the practice of wood preservation.

Urging Better Ontario Forest Fire Protection

Twenty-two of the leading Boards of Trade of Ontario, made representations recently to the Ontario Government, urging a reorganization of its forest protection system. Two reforms are specially asked for in the present system:—first, the reorganization of the rangers so as to provide supervision and inspection, both in the head office and in the field; second, that the Government should make some effort to keep down the loss of timber resulting from settlers' clearing fires.

For the latter purpose it is urged that a system of "permits" should be issued by fire rangers to settlers who wish to burn slash in the neighborhood of forests. A similar system has been operated successfully in Quebec and British Columbia for several years, without antagonizing the settler.

The widespread demand for a general reorganization of Ontario's forest protection work is being considered sympathetically by the Minister of Lands and Forests. The present system has been retained for many years with very little alteration. One of the objections taken to it is that the rangers, while sufficient in numbers, are left greatly to their own devices and do not secure good results. Forest ranging, according to modern practice, requires skilled men and skilled overseers. The proposal now is that the forest fighting service should be placed under the supervision of a specially qualified officer of the Department, having authority to develop the present service until it becomes more in keeping with the requirements of the situation.

How I Have Kept Ahead of Rising Costs

Effective Advertising, Valuable Service to Customers and Careful Credit and Collection Work the Keys to Success

By H. R. Isherwood

How to fight rising costs is a problem that has been under much discussion in many of the trade journals and popular magazines of the present day. I have read a great many of these articles, but have been surprised to find that most of them are written by jewellery merchants, hardware men, department store owners, grocers, etc., and very few of them by men in my own line of business. Yet in many of these articles I have found practical suggestions which I can apply directly to my own business needs—and I am engaged in selling lumber and building material at retail.

During each of the fourteen years since I have been in the retail lumber business, the cost of doing business has been steadily rising. When things have looked pretty dark, I have sometimes wondered whether the game was worth the candle. There is nothing original in that. We have all wondered that. Many of us are still wondering.

What I am going to give in this article is just a plain statement of facts containing a few "hows" which have helped me fight rising costs. If they contain helpful suggestions for some of my fellow merchants—suggestions such as I have received from previous articles—I shall be happy. The three principles on which I have built my success are: (1) more effective advertising; (2) better service to customers; (3) an unusually profitable handling of credits and collections. The third heading referred to above is one which I dealt with at considerable length in the Canada Lumberman of January 15, 1915.

Eight years ago I came to Sawyer, Door County, Wis., to take over a retail lumber yard. I was told that it was a small yard. It was. There was just about enough lumber and building material in stock to have built a good-sized chicken coop. I found that two competitors were all stocked, besides. I liked the country, thought I could see possibilities for the building up of a good business, and decided to stay.

Here I wish to explain the unique position of the town in which I have built up my business. Sawyer has a population of about fourteen hundred, and is the fourth ward of Sturgeon Bay, the county seat—which has a population of about thirty-six hundred. The Sturgeon Bay ship canal, a half mile wide, divides the ward from its adopted parent city.

Sawyer, therefore, suffers the handicap of competing in a measure with itself, for while it is under the same city government with the other three wards of the city across the canal, it has its own individual business institutions, post-office, banks, and the like. It has been said that the only real connection between the two towns is the drawbridge, and that it costs real money to cross it. This, however, is an exaggeration, for a large part of my trade comes across that bridge.

The first step I took was to canvass the county, studying its needs from a builder's viewpoint. Next, I stocked the yard to meet what I thought were the requirements of the community; installed a simple cost system, and got a line on my competitors' methods of doing business and general policies.

I was now ready to start advertising—this brings me to the first of the three methods I have listed. I discovered that beyond the sending out of the proverbial calendar, my competitors did not believe in advertising, although there are two good newspapers in our town. I made up my mind that every time I used an advertisement I would dominate a page of space. To do this at a small expenditure was a problem. Finally, I hit upon a plan that worked.

How I Got Attention at Small Expense

Instead of using a half-page spread or more, I designed my advertisements to be seven columns wide, and from three to six inches deep. I used a strong, distinctive border, a light faced type, easy to read, and always left plenty of white space. I made my copy educational, terse and snappy. In a town of five thousand, with two small papers not overcrowded with advertisements, a seven column advertisement stands out like a sore thumb, while the cost is not prohibitive.

When I was seventeen and fresh from the farm, my first boss impressed upon me a sound principle of salesmanship that applies to good advertising copy. He said: "Son, your job is to sell lumber, the kind the buyer ought to have. You can't sell a man lumber by talking about crops or the spavins on his horse. Stick to the subject. When you're through—quit."

My copy stuck to the subject. The appeal was concentrated on one or two lines. Every time I advertised a certain material, I told exactly why that material was best and cheapest when used for certain purposes. Again, every advertisement carried a personal appeal.

I urged consumers to come to us for an accurate estimate on the amount of material required for any specific buildings or repair jobs, regardless of whether or not they were regular customers. This service brought us into personal touch with the people in our community, though it took some time for them to realize that we meant business, and would give a detailed estimate on quantity and quality of material required for any work, with a total cost, without attaching a string to it. Later, I will tell you what advertising this service developed.

Our newspaper advertising was backed up by circular letters, sent out at regular intervals, pamphlets (furnished free by manufacturers of building materials), monthly statement inserts, and signs on fences, barns, and billboards throughout the county. My billboards are located on all roads leading into our town, along the railroad tracks, and on the lake front.

The name of every farmer, "renter," and property owner in the county was put on our mailing list, compiled alphabetically on filing cards. We keep after these names constantly, first on one thing, then another; at first, many of them came in out of curiosity—to look us over. They were all new people to us and it was up to myself and the sales force (local people) to demonstrate our business policies, find out their needs, show our stocks, and explain why this or that material was best and most economical when used for a certain purpose, and finally sell the goods or make a favorable impression for future business.

The first two years our advertising cost just five per cent. of our gross sales. After getting our business firmly established in the minds of the people, making them realize we were looking after their interests as well as our own, I was able to gradually decrease the advertising expenditure until it amounted to one per cent. of the gross sales. There it has remained for the past three years, while the sales volume of the Sawyer Lumber Company has increased five hundred per cent. in eight years.

Again. advertising has enlarged our field for usefulness in our community. It is eliminating competition. It allows us to operate on less capital and thereby saves on interest charges, because it creates business conditions for us, instead of our being compelled to adapt our affairs entirely to existing conditions. More than all that, it has educated the people in our community to the extent that they now believe that when they need lumber, they need us.

Now for "Sawyer Service"—my second method. That's what we call it—"Sawyer Service." Every merchant has his own ideas of giving quality, or service, or satisfaction—or whatever name he likes to use when describing it to his customers. Our strongest sales policy is a service policy.

The predominant idea which we instil into the mind of the purchaser is the fitness of the stock under discussion for filling the particular requirements for which it is to be used. It may be the entire bill of lumber for a dairy barn, hardwood flooring for one room in the home, or rough lumber for a pig-pen. The point which we wish to, and do, impress on the purchaser is to buy the best material for the specific purpose that he can afford. Every class of material has its grades; many have substitutes. After explaining the advantage of one grade over another, we leave the decision with the customer and his pocketbook.

These Service Plans Increased My Business Twenty Per Cent.

Now for the service the personal appeal in our advertising developed. I said that we offered to give anyone a detailed estimate of material for any specific building, with a total cost. Few people know much about lumber or manufactured building materials, or the correct uses for them. I am not speaking of carpenters, contractors, or jacks-of-all trades. I am talking about farmers—my customers.

Here is what happened one bright morning, after we had advertised this service for about a month. A farmer came into my office and asked me to give him a figure on the material required for the construction of a large dairy barn. I knew him as a customer of one of my competitors.

Placed an Order Amounting to Fifteen Hundred Dollars

"All right," I answered, "we will be very glad to give you a detailed estimate, and a total cost. Have you a plan with you?"

"Why, yes; here it is."

Sure enough, there it was—his own rough sketch of the first floor plan of the barn, on the back of an envelope. The length and the width of the building were marked, and the number of stalls required.

There was nothing to indicate the height, the plan of second-floor arrangements, the capacity of the hay mows, the grain bins, and so on.

I studied the plan a few minutes and did some tall thinking. Finally, I asked, "Now, Mr. Caldron, how do you want your second-floor plan arranged; how large a hay mow, and what capacity should your grain bins have to make them exactly fit your needs?"

"Why," answered Caldron, "I don't know. Bill Hawkins's barn just suits me, except that I don't like the way his grain bins are fixed. If you could take Jenkins's grain bins and Hawkins's hay mow an' combine them into a second-floor plan for me, it would suit me fine."

That seemed simple.

"All right, we can do that. How soon do you expect to build?"

"In about three weeks."

"When will you be in town again?"

"Oh, 'bout a week."

That afternoon I took a local architect out in my machine and we visited Bill Hawkins' farm, ten miles out. Then we drove on to Jenkins' place. When we got back we had driven thirty miles.

The architect had the idea of the two barns. I gave him model barn plans published in book form by one of the best modern barn equipment manufacturers, with orders to draw up a detailed first and second floor plan, side and front elevation, all on the same scale. This was done and a detailed estimate of all the building materials required attached to it, with a total cost. I figured the material and wrote the specifications.

Within a week Caldron came in. I took him into my private office, got him talking about his farm, cows, crops, and the like, finally getting around to the barn. Then I flashed the plans on him, all scaled correctly and marked in every detail. His eyes popped out and he exclaimed, "For goodness sake, how did you do it?"

"That," I replied, "is part of our service for our customers. These plans are accurate, ready for blue printing for your contractor. They are your property and will not cost you a cent, providing you buy the material for your barn from us. Here are the specifications in detail and the total cost. Now, frankly, Mr. Caldron, I have specified the very best material on the market, for portions of that barn, if it is to be built right, require the best.

By Explaining Just What I was Selling, I Won This Man's Trade

"In other places, not so important, I have specified just common cheap-grade lumber, where it will do just as good work as a higher grade. We will make any changes in the plans which you may desire. Before you decide on this bill, however, I want you to take these plans and specifications and have some other lumber dealer figure the material required. Get his figures on the same materials specified here. Then we will be in a position to talk business. I won't lower my price one cent, nor will I charge you for my plans. We will be glad to have your business if we can serve you satisfactorily."

He said never a word, but got up and walked out. Remember, he was my competitor's customer. Later on I found that he had been sent to me to find out how my system of giving advance estimates worked.

More Ways than One to Meet Competition

Two weeks later Caldron came back. He said, "Mr. Isherwood, I have got a lower figure than yours on my barn."

"Well, Mr. Caldron, are the figures given on the same grade of material as I specified, all the way through?"

"I think so, but I am not sure; here is the estimate. I wanted you to go over it with me and see. I don't know much about lumber, and I like the square way in which you have treated me."

We went over my competitor's estimate. Remember, I had given Caldron my estimate to take to my competitor. I soon discovered that my competitor had quoted prices on the same material, but on lower grades on nearly everything, with the result that his bid was considerably lower than mine.

I proved this to Caldron by showing him the latest market quotations listed on all materials specified. I also showed him that by using the lower grades of some materials he cheapened his building far and away above any comparison with the saving in price. After I had finished and had suggested that he think it over for a few days, he said:

"Well, I have traded with those people for a long time. I like them, and I am anxious to save what money I can. You have been a big help to me, and I like your plans. I will see."

I had not tried to close the deal with him in any way. I suggested that he refrain from closing it that day. What really happened was this. Caldron told my competitor that if they would furnish him with detailed plans as good as mine, he would close the deal. They replied that there were good architects in town and that they were not doing an architect's business.

About a week later I was out near Caldron's and dropped in on him.

"Mr. Caldron, I have come for my plans," I said. "If you are ready to go ahead I will have three sets of blue prints made; one for you, one for your contractor, and one for my office, so if you need any material while building, you can 'phone me, I can check it on the plans, and send it right out."

He looked at me a minute and said:

"All right, Mr. Isherwood, you're on. You have done me a big service. I will write you a check for five hundred dollars now. Ship the material right away."

The bill was for eleven hundred dollars, and extras ordered later by Caldron ran four hundred more. The plans cost me thirty dollars and a little head work.

Right there an idea took hold of me. "Why," I asked myself, "not make a business of furnishing accurate working plans and specifications for any building free of charge to customers buying materials for the building from us? I can take their rough sketches or ideas, have them worked out in detail by the architect, write the specifications myself, which will give me the opportunity to specify (as I did in the barn), the best material for the right place. It will help other people just as it did Caldron. I told Caldron it was a part of our service, and by jinks, from today on, it is."

How I Got Useful Data Free of Charge

I visited the architect and laid my plans before him. He was interested, and agreed to take charge of the work for a stated fee. He gave me innumerable files of house plans, ranging from a few hundred dollars up to twenty-five hundred dollars. Next, I wrote the manufacturers of the many different building materials I handled, outlined my general plan of operation and its purpose, and suggested that they send me samples of their materials, so that I might have everything pertaining to a building complete in a tangible form to present to the prospective builder.

I Had Little Trouble in Getting Valuable Samples for Nothing

The response from the manufacturers was immediate. Every mail and express for weeks brought bricks, samples of stained varnish, painted wood for exterior and interior work, linoleums, wall boards, miniature barn equipment samples, cements; in short, samples of every practical material used in the construction of farm buildings. The manufacturers flooded me with their finest samples and literature. To display this material required a large room. To make the material valuable it had to be displayed attractively.

We were just building a new office. Our architect designed one room for our "service department," for the display of sample materials, and a drafting room. This room was turned over to contractors and prospective builders. A door, which visitors may close, opens into my private office. There is an outside entrance opening on the street for those not wishing to pass through our general offices.

I make it a point with every prospective customer or builder to assist with the plans and specifications. I endeavor to keep economy in sight all the time; in fact, I make the specifications for the builder. This is a great satisfaction to my customers. Not only has it brought me results that I could not have obtained in any other way, but it has also made my clients "satisfied customers." This service has increased my sales volume twenty per cent. annually for the past three years. Fifty per cent. of the expense of this department is charged to advertising; fifty per cent. to the general operating expense, or "office overhead."

Just one thing more: I anticipate that merchants in larger towns may say "That idea may be practical in a farming community, but I don't believe it would work in a city."

Door county has some of the most attractive summer resorts on Lake Michigan and Green Bay. Every year from twenty to twenty-five thousand tourists come to the county. A number of southerners have built beautiful summer residences along the shores, and many of them have taken advantage of our service department from time to time with apparent satisfaction.

Last fall a wealthy business man from Kentucky came to me with plans for a shore home. He wanted the building done during the winter. We had built for several of his friends.

He had his own plans; we wrote the specifications. He stated the spot where he wanted his home to stand.

This spring he moved into his new home. It was complete in every detail. He had not seen it during any stage of the construction, though he seemed delighted with the finished product. I could cite dozens of similar cases.

Of Greatest Possible Interest

Editor, Canada Lumberman: Ottawa, Ont., May 29, 1916.

I congratulate you most heartily upon the uniform excellence of your Annual Number, both as to form and substance. It contains a very large amount of material of the greatest possible interest to everyone connected with, or interested in, the exploitation of the forest resources of the country.

Yours very truly,
Clyde Leavitt, Forester.

Lumbermen Join to Stop Forest Fires

Forest Protection Principles Practiced by Timber Owners in St. Maurice Valley Produce Good Results at Low Cost

By Henry Sorgius

THE question of forest protection as we see it in the province of Quebec seems to evolve itself in the saying, "In matters where rival concerns cannot outdo each other by competition they will all derive benefits by getting together."

Co-operative forest protection is no longer in the experimental stage. We are now able to look at records of the past four years and draw definite conclusions. Comparing these records with those of many years ago and analyzing the former systems of forest protection, the cause of success of the present system becomes obvious. Countless miles of blackened hills and barren rock are mute witnesses to the fact that lumber companies, although desirous at heart of keeping their timber lands intact, considered it an economy to make the smallest outlay possible in making some kind of a poor show at forest protection.

The men employed as fire rangers were seldom employed for that alone, nor were they held to answer to anyone regularly for their work. Dam keepers were expected continually to "keep the dam" and also "keep the fires" for an indefinite number of miles around; similarly with cache keepers who are not supposed to ever leave a cache; some logging foremen were often expected to attend to their work and at the same time scare away the fires a bit by being appointed nominal fire ranger. The drive clerks could also be requisitioned to make this "paper" fire protection look like something real. No explanation is needed here. Men who had some main object to attend to did not usually exert themselves in work which did not interest them very much and which, at certain times, might prove most annoying.

When fires chanced to occur near at hand, by the time the supposed ranger had finished thinking about it, it was usually of such size that he decided it was too big to be extinguished and probably felt some relief in studying the clouds to see if it would rain soon, in which case it would not be necessary to hire him anyway.

Some regular rangers also existed, of course. It must be remembered, however, that most lumber companies have their timber lands in patches in different localities, so that to protect all a very unequal division was necessary. Some men had to be placed in small isolated sections of good timber here and there, who, although not having enough to do, still were necessary. Under such circumstances the cost of ranging really became heavy. Again, as would naturally be the case under such circumstances, some companies were not concerned deeply enough to do any protection at all, and in pure self-defence for their own limits the companies who did protect had to look after the adjacent land of the lax concerns as well as their own, and bear the extra cost.

The Working Out of Co-operation

By a co-operative system as used by the St. Maurice Forest Protective Association, Limited, we have first a multitude of small areas and parcels of timber lands joined together to form one territory, and the most efficient ways of protecting the whole are considered.

The countless division lines which twist and turn to divide the timber land of each company are no longer existent for the organization of the association within its own boundaries. The whole question of efficient service is well planned out. All water courses and other features of the topography are taken advantage of in order to obtain one harmonious patrolling system. Certain tracts of land may belong to two or three different companies and yet be patrolled by the same men. In this way the cost has been reduced. Again, the men are employed to do nothing but look after the interest of forest protection. Every phase of the work is discussed and explained to them and the fire ranger becomes a sort of specialist in his particular work, incidentally learning to consider the one great factor—human nature.

The general organization of the St. Maurice Forest Protective Association, Limited, may be summed up briefly so as to get an idea of the method by which it has been found possible to give an efficient service at the low cost of one-quarter of a cent per acre, which is the assessment made upon all members of the association. The money obtained from this is used to cover the salaries of the rangers, equipment and other general expenses.

The cost of extra labor employed in fighting fires is partly paid by the Quebec Government and partly by a special assessment on all the members.

The whole territory under the association is divided up into divisions, each in charge of one inspector and the divisions in turn are cut up into districts for each ranger or two rangers. The inspector's duty is to oversee generally the work of all the rangers in his division. The interest of the association in the territory in his charge is entrusted to his care. He is expected to keep close watch on the way everything is going on so as to avoid all confusion among the men and to arrange their beats so as to give the most attention to localities which require it most. By continually travelling throughout his district he sees the condition in every part. It is his duty to keep in touch with all people in his district; to visit these people and get all the useful information possible. His diplomacy is often called upon, as he must keep everyone well disposed, if possible, and at the same time stick to certain fixed principles.

Duties of the Fire Rangers

The districts of the rangers vary in size according to the fire hazard in the various localities, and the industrial operations, which may change from one region to another. Briefly, the ranger's duty is first to prevent fires and secondly to put them out if they occur.

The rangers are made to realize that success may be hoped for only by educating the people. Friends are more useful than enemies. By taking men in the proper way it is often possible to make them understand the good cause for which all should work.

In settled districts the fire rangers are entrusted with the delicate task of supervising the burning of slash. The laws of the province heretofore were so lax and so seldom enforced that the making of new land was the greatest menace to the forest. The Quebec Government has, however, brought about several amendments to its laws, and thanks to this step, we can now hope that the vexatious problem of slash burning is about solved. The permit system of slash burning is now used. All settlers must first obtain a permit, then burn their slash at their own risk, under the supervision of the ranger. It has been most difficult to get the public to conform to this law, as it went "against the grain." People were sorry to see the old system stopped where they burned at any old time and in any way convenient to them. It mattered little if millions of dollars went up in smoke to prepare a small piece of ground for the planting of a few cents' worth of potatoes or other crop. The present change for the better has been brought about, thanks to the great help afforded by men of intelligence and foresight. The parish priests have done a great deal in this respect.

Many means were employed to advertise. Church criers were made to read the laws and inform the people as to slash burning; circular letters were sent around and interesting pamphlets were distributed, earnestly putting forth the cause and demanding the help of the people. Settlers' fires have been reduced in a most surprising manner by this method; i.e., 151 settlers' fires in 1913 reduced to 41 in 1915. The patrolling in settled districts is done with a horse and rig. The ranger becomes familiar with all his people and keeps well informed as to when and where there will be slash to burn. Having probably burnt very many slashes he becomes more or less expert at it and can help the farmers materially by having them piled and fired with maximum results and minimum danger and trouble. Patrolling with an automobile was tried last year and proved a huge success. The machine was far cheaper than horses and the rapidity with which the inspector using this could travel was most gratifying.

The rangers in the bush travel by canoe or on horse back. Their chief duty outside of the general principles of creating human interest, consists in keeping an eye on fishermen, drivers, jobbers and wood travellers. In damp weather they cut and clear portages to facilitate communcation, and make the transportation of men and supplies quicker when fires might occur at other times. They also locate high points suitable for look-outs or mere observation points and locate prospective telephone lines. The look-outs are placed, as far as possible, so that while the ranger travels around to see people he may also obtain a frequent view of all his territory. There are at present twenty-three permanent look-out stations, beside many other observation points. At different places in each district certain tools have been stored so as to be readily available in case of fire. These consist of about thirty-six implements per cache, consisting of shovels, axes, buckets, mattocks, etc.

Patrolling the Railway

There is also the patrolling along the railway right-of-way which is done by means of motor speeders. These machines cover 40 to 50 miles twice a day keeping track of all trains, inspecting smoke stacks and other parts of the locomotive on their beat. This part of patrolling is very efficiently carried on by four cars, with a spare car for the inspector or to replace any one which may be out of order. New shops have been erected so that most of the repairs on these

machines are now done by the association itself. Among the innovations of the year might be mentioned the trying out of a new pump, with 1,500 feet of hose, weighing only 130 pounds. A very substantial addition is expected to our telephone system, to cost $1,500, which has been set aside specially for this purpose.

In conclusion it might be remarked that the greatest economic problem before the lumber companies today is the saving of their source of income from fires. The very fact that it has taken so long for the companies to get together and form a strong protective organization shows that the education is just as badly needed by the lumberman himself. Co-operation between the companies has done, and will do, wonders yet. There must be co-operation between every different section of each company and the association, by raising a public sentiment and teaching the right and wrong of the matter to people, more by gentle persuasion than by force. We may hope that the day will yet come when, instead of looking the other way and walking faster when they see a fire, men will rather turn out of their way to try and put it out.

Retail Buying—Quality the Great Thing

Too Much Importance Attached to Selling as Compared With Purchasing Stocks—Quality the Greatest Selling Point

By the Man in the Yard

Which is the more important end of a retail lumber business, the buying or the selling of the stock? I would like to hear from readers of the Canada Lumberman about this. I do not expect any of them can settle the question definitely and for all time, but I would like to see their views in print, because they would be valuable to me and other retailers.

The reason I bring this matter up just now is that I have read articles about salesmanship in a great many trade journals. If I could remember them all I would know enough about selling lumber to be the best retailer in the business, but I have seen so little about buying retail stocks that probably if I depended upon what I have read on this line, I would make a failure of it in no time.

I don't mean to say that a great deal of importance should not be attached to the matter of selling, but I think it is given too much consideration as compared with the buying end; in fact the buying end has been neglected. If you get down to the bottom of the matter and hunt up statistics you will find that more failures in business are due to poor buying than to poor salesmanship. In fact a prominent authority, whose reports I read not long ago, stated that a great majority of business failures can be traced directly to unwise buying.

If we were all fully efficient as salesmen, perhaps we could carry much of it and I think we ought to give the subject a good deal more study than we do. I believe I can speak for a majority of retailers in this connection and say that this feature of their business is not as well looked after as it should be.

Talking of the good salesman being able to carry a certain amount of handicap in the way of poor buying, let us look at the other side of the picture and figure out what kind of profits he could make if, instead of a handicap, he had behind him at all times a stock of good lumber which had been well bought. We are accustomed to hearing people say, "well bought is half sold," and there is no doubt about this, but poorly bought stock, on the same line of reasoning, must be—in proportion to the bad judgment exercised in its purchase—unsaleable at a profit. In other words, it costs so much to sell poorly bought stock, that even if it seems to be something of a bargain in price, its quality, or the fact that the market does not call for it, may render it a liability rather than an asset.

Not a Really Difficult Matter

There really ought not to be much trouble about successful buying of retail lumber stocks. They are to a great extent staple lines. It should be possible for a retailer of fair experience to form a pretty clear idea how much of each important line of stock he can move in a year and to add to or subtract from it according to his information about general trade conditions in his district. The quantity problem is really not the hard one to handle. He may make a mistake here and there and lay in too much or too little of one kind of stock or another, but in the long run his experience should prevent him from making enough mistakes of this kind to have any appreciable effect upon his profits.

Where the retailer is most likely to make his mistake is in giving too much attention to prices and not enough to quality. The tendency of the present age, from a business point of view, is to everlastingly be on the look out for bargains. A retailer looking at different quotations on stock which he needs, is apt naturally to give his order to the firm whose quotations are lowest and to do so in many cases without satisfying himself properly about the relative qualities of the stocks. I have come to the conclusion myself that by giving orders always to the men who quote the lowest prices I would quickly put myself out of business. It is only once in a while that the lower price goes along with equal quality. Values are what should count. When I am buying stock the idea I have in mind is not whether the price is the lowest I can get, but whether there is a fair profit for me in handling the best quality of stock I can get at the price that the wholesaler asks for it. Quality is the real thing to consider, and every retailer, once he has satisfied himself about the quality of any particular line of stock that he is thinking of buying, should be able to tell, almost off hand whether he can dispose of it at a profit.

Quality a Better Selling Point than Price

The point I am trying to make is that the first thing to do is to be sure about the quality, then the prices may be compared. Do not compare the price first, or you may forget about the quality, and that would be fatal. Lower quotations almost always carry with them lower values and are really not so profitable a buy as better values at higher prices. Moreover, there is one's reputation always to be considered. If you are always watching for a chance to buy bargain stock you will make a reputation for yourself among your customers as a man who keeps only a medium, or even a comparatively low grade of stock. It is worth while, even from an advertising point of view, to make sure that the stock you buy is good, that is to say, that it will fill the requirements of your customers satisfactorily.

Every customer, as he walks into a retail lumber yard, has two ideas sticking out in his mind. One is the use to which he is going to put the lumber he buys, the other is the price he will have to pay. If you think the matter over closely you will find that your best customers have not much confidence in their ability to beat you down in price, but every one of them has a clear idea that he will insist upon getting the best quality of stock he possibly can. Quality is the retailer's best talking point and he should never forget it, particularly when he is buying his stocks. The dealer who has only price to use as a selling point is at a great disadvantage compared with the dealer who can talk proudly about the quality of his goods.

Especially when competition is keen, will quality talk carry much weight. If your competitor is giving you a bad time of it, getting many of your best customers, do not worry so much about the price of the stock you sell; do not try to cut prices, but try to give better value than he does. Make sure that your stocks are the kind your customers want and they will not be so ready to tell you that they can get them cheaper at the other yard. The only way to do this is to post yourself as fully as possible about the buying end of your business, and then make a practice of giving it equal if not more attention than the selling end.

The Cameron & Genoa Mills Shipbuilders, Limited, which was recently organized, has leased two acres of tidewater land on the inner harbor near Point Ellice Bridge, Victoria, B. C., on which they will locate a yard for the construction of wooden lumber vessels. At the back of the organization are Messrs. J. O. and D. O. Cameron, of the Cameron Lumber Company, and the Genoa Bay Lumber Company. The property leased has a water frontage of 350 feet and the lease is for two years, at a rental of $100 per month. Shipbuilding operations are to be commenced at once and to be carried on continuously. Provision is also made for extension of the lease for a year. The company anticipate that 15 wooden vessels will each have a carrying capacity of 1,500,000 feet of lumber and will cost $120,000, exclusive of machinery. The machinery equipment will bring the total cost up to $170,000 each. It is planned to lay down two ships at once and to employ 300 men when the work starts.

Editor, Canada Lumberman:— Sawyer, Wis.

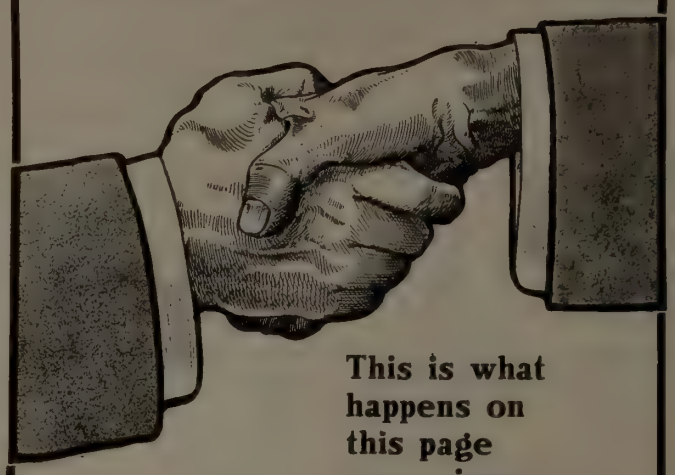
Your Annual Number is most interesting and it is certainly one that will attract a great deal of attention. You deserve much credit for the advertising in your journal, and the way you have made the display in general. The various articles are of great interest to me. I note that the ideas, not only from the retailers, but from the wholesalers of Canada, are leading those of the States.

Yours very truly,
H. R. Isherwood.

Mr. Buyer

Are you in the market for a special bill of lumber? Would you like to pick up a real good second-hand planer or perhaps some logging equipment? Have you a vacancy in your plant for a filer or other employee? If you answer "Yes" to any of these, advertise on this page. It is the "Master of Ceremonies" and will introduce you to the man you want.

The Master of Ceremonies



This is what happens on this page every issue

Mr. Seller

You are looking for the man who is looking for you—you have for sale what he wants. All that is needed is an "Ad" on this page to bring you together. Appeal to this "Master of Ceremonies" and send us a small ad. today. What can we sell for you—or perhaps we can find you a job.

Send along your ad.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Maple, Birch and Beech

Wanted to buy: 2½ in. and 3 in. Maple, Birch and Beech, No. 2 or No. 3 Common. Apply M. Brennen & Sons, Hamilton, Ont. 12-12

Wanted to Buy

750,000 ft. 2 in., 2½ in., 3 in. and 4 in. log run Birch. Terms 75 per cent. cash on shipment, balance on arrival. Apply P. O. Box 643, Montreal, Que. 9-12

Wanted—Lath

Please quote us your best cash price on the following, either delivered Cleveland, Ohio, or F.O.B. Mill, giving rate to Cleveland:

⅜ x 1½ — 4 ft. No. 3 White Pine Lath.
Same—Red Pine.
Same—Spruce.
⅜ x 1½ — 4 ft. No. 2 White Pine Lath.
Same—Mill Run White Pine Lath.
Same—Spruce.

1502 New England Building,
12-15 Cleveland, Ohio.

Business Opportunity

Make your opportunity knock at the door of every Lumberman in Canada by placing a small "Ad" about it in this column. Our rate is $2.10 per inch per issue. Now is a time when monied men are seeking good bargains. What have you to offer? 1-t.f.

For Sale–Lumber

For Sale

One hundred thousand feet of 4/4 Basswood, Ash and Elm crating lumber. S. L. Purdy, Coe Hill, Ont. 11-12

For Sale

500,000 Western Ontario White Pine Logs. Can be sawn to your order. Those interested please write Hall Brothers, 174 Mutual St., Toronto, Ont. 9-12

For Sale

2,000 Cedar Poles 25 to 45 ft. long; 4,000 Cedar Fence Posts 4 in. and up, 8 ft. long; 2,000 No. 2 Cedar Ties, 3 in. face and up. Lynch & Ryan Lumber Co., Marmora, Ont. 12-15

Slabs and Edgings

Wanted a buyer for the slabs and edgings from our saw mill cutting 25 M. feet B. M. per day, Maple and Birch, also Ashes from our boilers. Additional supplies of hardwood can be purchased in the vicinity. Reply to Box 410, Canada Lumberman, Toronto, Ont. 11-12

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale–Machinery

Timber Limits and Mills

Timber limits for sale in the District of Algoma, also a Band and Gang Saw Mill. For particulars apply to Geo. Niebergall & Son, Parry Sound, Ont. 11-13

FOR SALE

Woodworking Machinery

The following second-hand machines have been placed with us for sale:
1 Woods No. 32 Matcher; 1 Goldie 10-in. Moulder; 1 Goldie 24-in. Matcher; 1 Cowan 42-in. Sander; 1 Jackson Cochrane 36-in. Sander; 1 Egan 36-in. Single Surfacer; 1 McGregor Gourlay 2-drum 30-in. Boss Sander; 1 Egan 30-in. 2-drum Sander; 1 CMC 8-in. 4-side Sticker.

P. B. Yates Machine Company, Limited,
10-t.f. Hamilton, Ont.

Machinery For Sale

A small "Ad" under this heading, telling of what machinery you have for sale, will immediately put you in touch with buyers. Send us a list of machinery items and we will quote you on a small "Ad." Send the list now, before you forget about it. 1-t.f.

Wagons and Machinery

Two Heavy Lumber Wagons, Sweet Roll Off Type, one Greenlee Power Feed Rip Saw, one C. B. Rogers Planer and Matcher, with four pair Shimer Heads, one St. Louis Bench Grinder.

The Bertrand, Lockhart Lumber Co., Ltd.,
12-12 Port Arthur, Ont.

Machinery for Sale

Cowan No. 204 Planer and Matcher, 15 x 6 in.
Cowan No. 152 12-in. four side Moulder.
Ballantyne 8-in. three side Moulder.
Ballantyne Door Cramp, 4 ft. by 8 ft.; foot power.
McEachren Dry Kiln Heater, 1,000 ft. coil, 36 in. Fan.

Will consider 8-in. four side Moulder in an exchange. All machines are good, in first-class condition, recently new, and some have extra attachments. These machines are in our way and no reasonable offer will be refused.

GALBRAITH & COMPANY, LTD.,
12-12 Owen Sound, Ont.

Machinery For Sale

Woodworking Machinery for sale, consisting of Planers, Band Saws, Hardwood Flooring Machines, Mortisers, Buzz Planers, Shapers, Mitre and Tennoning Machines, etc., also Steam Boilers and 300 H.P. Steam Engine, Shafting, Pulleys, and large quantity of leather belting. Also a complete Sawmill outfit, a large stock of Rough and Dressed Lumber, Sashes, Doors, etc., manufactured and in process of manufacture. Reply to the Tobin Manufacturing Company in Liquidation, Bromptonville, P.Q. 12-15

Machinery For Sale

Refuse Burner, 24 ft. diam. 100 ft. to spark arrester; all grate bars, 4 base doors, lined with fire brick; in good condition.

Smoke stack 7 ft. x 130 ft. to spark arrester, a1 condition.

Three Boilers, 6 ft. x 16 ft.; 70 4-in. tubes, 2 fire doors, 2 draft doors, fronts in a1 condition.

One No. 8 Buffalo Forge Co. Blower.

One Dean Duplex Steam Pump; 2—14 x 14 steam end; 2—12 x 28 water end, valves and piping.

All angle iron frames and galvanized roofing for large fire room.

All or any part at bargain prices.

Box 390, Canada Lumberman, Toronto, Ont.
10-12

Wanted–Machinery

Lorries Wanted

Fifteen second-hand lumber lorries, must be in good condition. Campbell MacLaurin Lumber Company, Limited, Drummondville, Que. 11-14

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

LUMBER SALESMAN WANTED. One with experience in hardwood and veneers. Apply by letter stating qualification and salary. Robert Bury & Co., 455 King Street West, Toronto, Ont. 12-12

INSPECTOR WANTED—A man capable of inspecting both hardwood and softwood, and shipping same. State references, experience and salary expected. Box 394, Canada Lumberman, Toronto, Ont. 9-12

BOOK-KEEPER WANTED to act as Secretary-Treasurer of a Lumber Company with $100,000 invested; in first-class condition and operating. Applicant must be willing to invest $5,000 or $10,000 in the capital stock of the Company. A young man preferred, who is not eligible for active service, and one who has some knowledge of the lumber business. Must have good record. Apply to Box 406, Canada Lumberman, Toronto, Ont. 11-12

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

WANTED—Position by a first-class Accountant and office manager. Lumber business preferred. Acquainted with all departments of office work in connection with the lumber manufacturing business or lumber yard. Am capable of taking charge of any set of books. Fifteen years' experience. Married, 38 years of age. Strictly temperate and reliable. Best of references. Am employed now on monthly engagement. Apply stating salary and particulars to Box 419, Canada Lumberman, Toronto, Ont. 12-13

BAND OR CIRCULAR FILER or Mill Foreman wants position. Twenty-seven (27) years' sawmill experience. Gilt edge references. Box 405, Canada Lumberman, Toronto, Ont. 11-1

POSITION WANTED—By man thoroughly experienced in lumber, either in the woods, around the saw mill or in lumber yard. Ready to go either east or west, but Ontario preferred. Address Box 415, Canada Lumberman, Toronto, Ont. 12-12

Accountant, with 13 years' experience in the lumber business, wishes to make permanent connection with good concern. Modern methods, and capable of taking complete charge of office and financial end of business. Has also good knowledge of white pine grades and values. Clean record, and recommended by prominent business men. Apply to Box 417, Canada Lumberman, Toronto, Ont. 12-12

Business Chances

For Sale

Brick and frame factory and site on Railroad in Toronto, now occupied as woodworking factory. Dry Kiln and Sprinkler System in connection. Apply Box 412, Canada Lumberman, Toronto, Ont. 12-12

Saw Mill

For sale on Muskoka Lakes, saw mill complete; daily capacity 20,000 feet. Good trade connection; plenty of timber available. Rare opportunity. Must be sold. Owner deceased. Terms reasonable. Box 418, Canada Lumberman, Toronto, Ont. 12-15

For Sale

To close an Estate, the valuable Lumber Mill known as the Picnic Island Mill at Little Current, Ont., Georgian Bay, is offered for sale. Capacity about twenty million feet of lumber per season. Extensive docks with sixteen feet of water and booming capacity for about fifteen million feet of logs.

Picnic Island, which is freehold property, consists of thirty-seven acres, containing the mill and twenty dwelling houses for employees. Superior drying grounds. Can ship by rail or water. For further particulars write,

James Battle, Thorold, Ont.
Administrator Estate of Late John Conlon,
or
Thomas Conlon, 44 Church St.,
St. Catharines, Ont.
10-13

Knots in Wood Defined

Definitions of knots in wood as adopted by the American Society for Testing Materials are as follows:

Knots in timber are classified as round and spike in form, and as sound, encased, loose and unsound in quality.

A round knot is either oval or circular.

A spike knot is one sawn in a lengthwise direction; the mean or average width being considered in measuring these knots.

A sound knot is solid across its face, and as hard as the wood surrounding it; it may be either red or black, and is so fixed by growth or position that it will retain its place in the piece of timber.

An encased knot is one whose growth rings are not inter-woven and homogeneous with the growth rings of the peace it is in. The encasement may be partial or complete; if inter-grown partially or fixed by growth or position that it will retain its place in the piece, it is considered a sound knot; if completely intergrown on one face, it is a watertight knot.

A loose knot is one not firmly held in place by growth or position.

An unsound knot is one not as hard as the wood surrounding it, or having a hole in it.

Review of Current Trade Conditions

Ontario

It would be a difficult matter to give anything like an adequate or a useful idea of current lumber trade conditions in Ontario. Conditions seem to vary so much from day to day and from place to place. That they cannot be summed up in a description, unless one is content with saying that the trade is spasmodic. On the whole, however, when one considers the numerous adverse factors that exist, the average volume of trade is satisfactory, and so are the prices. Wholesalers report conditions as above, and tell also of more than the usual amount of trouble in making collections. As to prices, all lines of stock are fairly firm. Dry hemlock is off the market. Shingles are firm and so are all lines of B. C. stock. There are no important tendencies to note which would lead to a drop in prices. Manufacturers in northern Ontario report a fairly active demand. A week or two ago United States buyers visiting north shore firms were paying what was considered to be rather fancy prices, namely, about one dollar per thousand feet higher than the prices of a year ago. In connection with such sales, moreover, the buyers, in some cases, have agreed to pay each month 95 per cent. of the price of the stock cut.

The shell box trade continues on an active basis. Extensive tenders were called for by the Imperial Munitions Board, closing on June 6th. When these are awarded they will create a good demand for shell box stock. The tenders referred to are for 750,000 eighteen-pounder shrapnel boxes and they will require between five and seven million feet of hardwoods. and from ten to fifteen million feet of softwoods. The contracts are to be allotted between Ontario and Quebec firms.

Eastern Canada

Continued improvement is reported in the trade situation at Montreal and throughout Quebec Province. Building operations are increasing in many parts of the province. The new contracts for shell boxes will cause much activity in box plants. Exports to the United Kingdom have been increasing, as more space has been available on vessels and the freight rates have been showing a tendency to drop. Space has recently been secured at 375 shillings, whereas, a short time ago it was hard to find even at 400 shillings. This is one of the most encouraging trade developments that have occurred in many months.

The retail situation in connection with eastern spruce at Boston continues rather uncertain. Yard owners are still cautions about increasing their stocks of spruce frames and are not making any extensive purchases for future requirements. A considerable consumption, however, is in progress for building operations, and the winter's cut of logs will not last out the present year at the present rate of sawing. The current quotations on spruce frames is about $27, and some business is reported at $26.50. There is a better demand for random than for frames, and current quotations are:—2 x 3, 2 x 5 and 2 x 6, $21 to $22; 2 x 4, $22 to $22.50; 2 x 8, $25 to $25.50; 2 x 10, $26.50 to $27; 2 x 12, $27.50 to $28. Enquiry for spruce boards is good and prices are steady. Covering boards, 5 inches and up wide, 8 feet and up long, bring $21 to $22; matched boards, 10, 12, 14, 16 feet, are selling at $25 to $26.

A satisfactory demand for hardwoods is reported at Boston and prices are firm. Current quotations on first and seconds, one in., are: basswood, $44 to $46; maple, $43 to $45; red birch, $57 to $59; sap birch, $47 to $49; white ash, $56 to $60. A considerable volume of business is being transacted in hemlock at Boston and quotations are about steady at $1 or more above the prices of last winter.

There is a fair business in white cedar shingles at Boston. White cedar extras are selling at $3.50 and some good brands are bringing $3.60. Clears are quoted at $3.20 to $3.30. Red cedar shingles are rather scarce. Very good lines are bringing $4.

Great Britain

The volume of import of stocks of lumber to London is comparatively light. Considerable quantities of wood goods are still leaving the docks, but otherwise there is not much movement. Values remain about the same as at our last report and are not showing much tendency to advance, as the amount of ordinary business is remarkably small. In fact the trade is practically marking time. The restrictions upon the imports of floorings and ply wood have been removed. Deliveries at London docks for the week ending May 13th amounted to 4,155 standards as compared with 5,280 standards during the corresponding week of last year. At Foy, Morgan & Company's recent auction sale, 3 x 4 in., 8 to 17 ft., 1st, 2nd and 3rd red pine from St. John brought £26 10s per standard. Hemlock, 2 x 4/14, 10/22, from St. John brought £20 5s. Hemlock 3 x 9, 7/18 from St. John brought £22 5s. Spruce, 4 x 6/11, 9/18, unsorted sold at £25 5s, while 2 in. and 2½ in. x 7 in. and 8 in., x 9/20 unsorted from Halifax brought £25 15s per standard.

The c.i.f. market for spruce deals at Liverpool continues rather quiet. Values are firm as a result of the continued shortage of supply. Still better prices are expected because of the increasing rate of freight, which now stands at 400s per standard. It is quite possible that this may bring about some easing off on the part of shippers in their chartering. There is little change to report in the situation at Manchester. A steady run of business continues and is expected to do so during the progress of the war. Prices are steadily advancing. Spruce deals are selling at about the following figures:—3 x 11 at £36 per standard ex quay; 3 x 9/10 at £34; 3 x 7/8 at £32 10s; 3 x 6 and under at £31 10s. Floorings are selling at various prices up to £35. High prices are quoted for birch, elm, oak and other hardwoods.

At Glasgow, the market continues quiet and it is not probable that there will be much improvement for some time to come. A good demand is expected from shipbuilding sources sooner or later, but other ordinary trade channels are quiet. Special requirements are still fairly good, and there is quite an active demand for such material as they need, especially for white pine, prices for which are still on the upward grade. The present value of 9 in. x 3 in., ordinary lengths, is about 4s per cubic foot, and other sizes are correspondingly high.

United States

In spite of the fact that everyone in the United States has been taking intense interest in political developments connected with the nomination of candidates for president, the business situation is apparently unaffected. In normal years the opposite would be the case. Commerce and industry, however, are this year enjoying abnormal activity which has not been reduced by the political situation. A recent report by Bradstreets says:—"Trade in furniture at the principal producing centres for the elapsed portion of the year has been sixty per cent. heavier than that done in the corresponding time last year. Railway cars are in better supply; traffic is the heaviest ever known at this season, and western roads are said to be preparing to spend large sums the next twelve months." At present, however, the railroad car building trade is marking time to a considerable extent. Car foundries have bought extensive stocks which are sufficient to take care of their operations for the time being. Railroads are showing a growing tendency to return to the more general use of wooden cars. An important announcement from New York states that, as a result of the clearing up of the congestion in eastern terminals, the embargoes that have been in effect on railroads are likely to be lifted within the next few days. This will make it possible to forward shipments of lumber that have been held up for a long time.

The building situation continues quite favorable, particularly in New England. With the removal of the railroad embargoes it is expected that building activity will show quite an increase. In the middle west also there is a large volume of building under way.

Further improvement is reported in the statistical position of the southern yellow pine industry. For the week ending May 26th a further curtailment of production was reported and shipments from 152 mills showed an increase of 3.11 per cent. A continuation of such improvement will put the yellow pine market in better shape. At present, however, the yellow pine trade is far from satisfactory and will stand a lot of improvement.

Reports in regard to the hardwood situation show a perceptible decrease in stocks on hand at manufacturing points, and a very satisfactory situation in regard to orders on hand. Northern producing points report that the hardwood market is especially strong, stocks in shipping condition showing a continually increasing shortage. A good demand for hemlock continues and prices hold firm.

R. M. Connely, widely known among lumbermen in New Brunswick, died at his home, Great Salmon River, recently. Mr. Connely was for many years manager for the C. M. Bostwick Mills at Point Wolfe. When the property was sold to the Pejepscot Lumber Company, Mr. Connely was retained as manager and had fulfilled his duties in this position for the past seven years.

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Trade Suffering from High Ocean Freights

St. John, N.B., June 8.—(Special to The Canada Lumberman).—The market at the port of St. John stands in a very strange condition. Shipments of lumber both to Great Britain and the United States are far from satisfactory. There is the same old story to tell in so far as shipments to Great Britain are concerned, viz., no tonnage. What the future will bring forth is hard to tell; freights have been climbing month by month, and the end does not seem to be in sight, 380 shillings being recently paid from St. John to British ports. The market for British goods seems to be as good as it has been, even though freights are rising. After the freight, insurance and risk have been added, the purchaser of deals has to pay a price heretofore unprecedented. As an example, £8 to £9 was formerly a fair price for spruce deals at Liverpool, while to-day, £28 to £30 is an average price. The seller on this side of the water is not reaping the harvest, but the steamships. To-day, deals cannot be disposed of at St. John, as the English buyers refuse to contract ahead for any further supplies, claiming that they prefer to wait until they are in great need rather than buy and ship on the high rates of freight, for if they were left with stock on hand at the end of the war, paying, as they have. the very high rate of freight, they would not be able to get a price which would mean anything but a loss. No Government orders are being placed at the present time. This time last year a great many orders were on hand and being filled for the allies. If the war keeps up, no doubt more supplies will be needed. It is hard to-day to make prices for deals, but they would no doubt be as good as a month ago, viz., $17.50 to $18 per M. for ordinary specification,viz., 50 per cent. 9in. x 3in. and up, balance 7in. and 8 in. x 3 in., with $2 less for 6 in. x 2 in. and $2.50 less for 3 in. x 4 in. to 5 in., and 4th quality, deal ends 2/3 regular. There is really no stir in the market and few vessels are loading.

The American market is not in nearly as good shape as it was two weeks ago. The base price of schedules at Boston has dropped to $26 per M. ft., with, it is understood, further concessions being offered. No enquiries from that market are now coming to St. John.

Laths are also weakening, but not to the same extent as long lumber. It is impossible to quote f.o.b. prices for American stock at this port, but we do not believe they would average much over $17 per M. for good specification.

The pine market at St. John is pretty well depleted, so far as stock is concerned. The West India trade has been good, as well as the American call for box pine, and therefore the market is well cared for, especially low grade boards.

Shingles remain steady, but no great stocks of logs are held here, and outside shingles control the market. The drives in the main river are coming along well since the last rise of water a few days ago. Rafting operations are being carried along by the St. John River Log Driving Co., having started some ten days ago.

Improvement Continues at Montreal

Montreal, June 9.—(Special to The Canada Lumberman).—The better conditions in local trade noted in our last issue have continued. The building reports from all over the province indicate more activity, and, for the first time this year, the permits for Montreal show an increase, taking them month by month. Those for the month of May totalled $767,069, a gain of $237,902. For the year, the value was $1,686,294, or a decrease of $708,700. During the last fortnight some large building plans have been announced, including two important theatres and an extensive industrial plant. The immediate outlook is therefore brighter.

Box makers anticipate more business. The Purchasing Commission asked for tenders for 800,000 shell boxes, principally of the 4-round 18-pounder class, and tenders were sent in on the 6th inst. There are again complaints at the low prices tendered by some firms, who apparently omit to figure overhead and other charges in their bids. This tends to reduce prices to such a level as to preclude a living profit to any box maker.

Only a small business is passing in dimension timber.

A considerable amount of lumber is being shipped to the United Kingdom. The space available continues to be fairly satisfactory, considering the shipping situation, and exporters are sending all the lumber possible. Freights, too, have a tendency to drop, 375 s. per standard having been paid as against 400s., at which space was recently taken. The arrival of the boats is rather irregular, thus inconveniencing shippers, but this is only a minor consideration when set against the improvement in the amount of tonnage and the reduced freights.

The market for sulphite continues strong. European supplies for the United States are still small, and a general strike in Norway threatens to curtail the imports further. The demand for Canadian pulp is excellent, and considerable quantities are being shipped to England and France. Ground wood is in moderate request, and prices are about maintained.

Saw Mills Likely to Curtail Output

The West Coast Lumbermen's Association, in a report from Seattle, Wash., under date of June 3, says:—Apparently influenced by surplus stocks and price concessions of competing woods in important selling territory, West Coast lumber is showing its first sign of market instability in many months.

Changed conditions were quickly reflected in this week's trade barometer of the West Coast Lumbermen's Association, which indicated new business nearly eighteen per cent. under production; and shipments nearly seven per cent. under production.

Notwithstanding this showing in the percentage column, the actual volume of business is considered fair in view of the fact that railroads generally are out of the market until after the June meetings, that country trade is always light during crop work; and that the well-organized larger buyers in the principal lumber markets, in the pursuit of their own particular problems, are exchanging stocks, rather than making new purchases.

Word has reached the coast that fully half of the enormous yellow pine capacity of the south is decreasing cut and surplus stocks by shutting down the mills one day a week.

There seems to be a growing but unorganized sentiment in Oregon and Washington that a similar curtailment is likely to work itself up in the fir district, during the months of June and July, not including the customary week or ten days' shutdown early in July for mid-season overhauling of plants and equipment.

One or two larger operators have even suggested the possibility that rather than attempt to cut lumber at less than cost of manufacture, they will close their mills until market conditions are more satisfactory.

In addition to the general feeling favorable to decreased production during the off season, the waterfront strikes are having a tendency to restrict mill operations.

Charter Rates Likely to Continue High

V. S. Hodges, manager of the lumber department of Hind, Rolph & Company, San Francisco, in a recent interview expressed the opinion that the present high charter rates for the shipment of lumber from Pacific Coast ports are bound to keep up for some time after the war. In fact they might be expected to continue for a year after the close of the war. Only a few sailing vessels were now open for charter next year, Mr. Hodges said. At present it looked as though freights would go still higher. The Hind, Rolph fleet numbers 23 sailing vessels and all are fixed with cargo for the next year, or the next year and a half. During the past year the ownership of the lumber sailing vessels of the Pacific Coast has greatly changed. Formerly the ownership was scattered among a large number of shipping men. Now, 75 per cent. of the fleet is owned by eight firms.

Logging Industry More Active in B. C.

Activity in the logging industry on Vancouver Island is becoming general. Many new camps are being started up, including one for the Island Lumber Company, of Duncan, B. C., and two for the Mainland Lumber & Shingle Company. Many small operators are engaged in taking out ties, shingle bolts, cordwood, mining props and tiles. In the Cowichan District the Tyee and Westholme sawmills, which have lately resumed operations, are running full time on orders for the east. The Island Lumber sawmill at Duncan is expected to operate shortly. At Port Alberni, the Alberni Pacific Lumber Company is despatching an average of 14 cars daily, in addition to three shipments of lumber for the Alaska trade, since the mill was reopened. The Alberni sawmill will probably resume cutting at an early date.

SUPPLIES

Everything in the Grocery line that's needed for the Camps—we are ever on the look out for goods that will meet your requirements and now have on hand a number of splendid lines which you can without doubt use to good advantage in these times of rapidly advancing prices for all food products. Here's a little list. If you notice anything that you can use we shall be glad to hear from you.

Why Architects and Engineers Want Branded Timber

By Frank D. Chase*

There are two words in the modern English vocabulary which one feels are somewhat overworked. One is "efficiency" and the other is "standardization." The fundamental in this question of branding lumber becomes a question of standardization. I wish first to mention one or two other industries briefly and then let us see where lumber stands in comparison.

Steel: It is only a few years ago since structural steel came to be used to any extent. The first steel structures were built less than fifty years ago. In this short span of years the steel industry has become one of the great industries of this country, and structural steel is a standardized product, so much so that to write a specification covering structural steel it is only necessary to say that it shall be in accordance with Manufacturers' Standard Specifications, as per last revision, and give the grade or kind of steel desired. Of course, the architect sometimes writes ten or fifteen pages of specifications in order properly to impress his client, but it is all covered in those six or seven words.

The manufacturer sees to it that the steel manufactured is up to this specification, and does this by means of extensive chemical and physical tests obtained in his laboratories. And when we buy steel from the jobber or manufacturer we can get a record of every piece of that steel, together with its physical and chemical properties. It is frequently desirable to have steel tested and inspected in addition to manufacturers' tests, but it is becoming less and less necessary to do so. The chemical and physical tests of steel are not simple nor inexpensive, but it was essential that some protection be afforded the purchaser.

Cement is now being manufactured at the rate of approximately one million barrels a day in this country and the manufacturers of cement have standardized their product so that we can buy cement without the necessity of having it tested in the laboratory. This is done by the manufacturers, who comply with the rigid specifications of the American Society for Testing Materials and the Railway Maintenance of Way Association. It is not considered necessary to-day to test cement which comes from a reputable manufacturer. He knows that his cement may go into a reinforced concrete building which will be tested after construction and he can not afford to risk his good name on a product that is not up to the standard set by himself as well as his competitors.

Creating a Standard Reputation

Take a building material which one might imagine above all others would be subject to the uncertainties of scores of manufacturers —roofing felt: The Barrett Manufacturing Company has, through standardization and publicity, created a national reputation, as well as market, for its brands of felt and pitch. It rarely happens that I design a building of large roof area that the owner does not ask me regarding the merits of the Barrett specifications.

Brick and other clay products have been tested by college and other laboratories until their capabilities are clearly defined, and all building codes are very definite in the way in which brick, tile and other clay products may be used.

You have heard, perhaps, the little story of the old Scotch woman who was going to have a home built for her, and her architect showed her the sketches and described to her the beautiful stained glass windows which were to be provided. She remonstrated and said that she did not want any stained glasses; she wanted just the plain, clear glass, just the way the Lord made it. This is what is said of lumber. We want lumber just the way the Lord made it, and He made lots of good lumber, too. There are no more physical difficulties in the way of grading and classifying lumber than there are in classifying and grading cotton, wool, tea, coffee or any other products of the soil. Wheat has forty-four grades and kinds on the Chicago market, and every natural product has a classification which requires an expert to identify it.

I could continue this list indefinitely; it is not necessary. I am simply trying to prove that all products, manufactured or otherwise, are made by and sold on clearly defined and easily recognized standards. The standardizing is, I believe, the foundation which must be laid for the creation of a market for lumber or for other products, and no national market for lumber or any other product will be developed until this foundation is made. As applied to lumber, I believe the corner stone of its foundation, to carry my architectural simile a little further, is the branding of lumber.

Why the Architect Wants Branded Lumber

You wonder why the architect is interested in a market for lumber or in standardizing to the extent that you have a national market, a market where a man can go and buy a stick of lumber, or a carload, or a trainload, as easily as he can buy a carload of steel or of cement.

The architect is interested in this, and this is the first big reason why we want branded lumber. He wants to be able to go into the market and buy exactly what the specifications call for and know that he is going to get it. If we want a cake of soap we do not go into a store and ask for a cake of soap. We say we want a cake of Ivory soap or Pear's soap, or some other soap. That soap is branded and we get exactly what we want. If we want a hat we do not specify a hat, we specify a Knox or a Stetson or somebody's hat, depending on what we want to pay, but we look into the crown to see if the label is there. The same is true of gloves, suits, furniture. If you send your little boy to the store for the soap, he gets what he asks for. It is branded. We do not have to write a letter describing it. All he does is mention the name.

When the architect can get the lumber that he specifies in any and every yard of any and every manufacturer we know that we have a national market for a standardized product.

Does this seem unnecessary to you? Do you realize that there are two or three factors that make this very desirable, that make this very necessary? In the first place, buildings are designed not merely to house machinery; they are made for people to live in and work in. They are subjected to all kinds of abusive loadings. They must be safe for human habitation. They must do the work they are designed to do. The architect is paid to see that they do. He can not to-day be certain that the lumber that goes into his buildings will meet the requirements. The recognition by municipal ordinances of the qualities of lumber is instructive on this point.

The man who uses structural longleaf in a building in the city of Chicago uses about forty per cent. more than should be used. This at first glance looks as if it might be a very nice proposition, and I have an idea that some few people in the city look at it in that light. Look at it in another light, however, which has gone from a candle to an arc light in the last few years—the amount of competition with reinforced concrete. Instead of using timber for many buildings that forty per cent. penalty puts them out of the running, and the result is the use of reinforced concrete. I take the position that forty per cent. penalty means not a profit on forty per cent. additional lumber, but a reduction of a good deal more than forty per cent. in the amount of lumber that would be used if we could figure lumber at its proper values.

To be specific, the fiber stress of longleaf pine as allowed by the ordinance of the city of Chicago is 1,300 pounds per square inch. This is forty per cent. less than it should be; 1,800 pounds is recognized good practice. Other cities discriminate in the same way, some to greater and some to less extent.

I am just completing a building in which there is approximately 4,000,000 feet of lumber. This building is outside of the city of Chicago. It is designed for very heavy floor loads, and there are excellent reasons for making this building of timber construction, and because of those reasons I wished to use it. Had this building been built in Chicago it would never have been built of lumber; it would have been a reinforced concrete building without the slightest question, because with the loadings which were figured concrete as against longleaf pine at 1,300 pounds fiber stress would have been very much cheaper.

The city building department stands ready to endorse an ordinance giving to longleaf and fir an adequate fiber stress just as soon as it can have definite assurance that the timber going into the building is what is specified. And there is only one way in which it can have that assurance, and that is for the inspector of the building department to go to a job and see with his own eyes the brand of your association, stating exactly the grade of the timber. That puts the timber in the class with structural steel or any other building material, and he would have no more necessity for questioning that timber than he would for questioning the structural steel which goes into a building.

Another Angle to the Branding Question

There is another angle to this question of branding, which I believe comes in here, and that is the question of giving the producer's name on every piece along with the brand indicating the grade. I do not know whether it should be considered in the same way and at the same time, but I personally cannot see how one can be done without the other. There is hardly a product on the market that does not bear the manufacturer's label, and we know that trade names are worth millions and millions of dollars.

Most of you saw the play last winter called "It Pays to Advertise." That comedy preached a better sermon than I have ever heard on the subject of what a trade name is worth, and I recall that play to you for your consideration in connection with the marketing of your product.

It is absolutely idle to deny that a man would not purchase lumber of a brand that he knew was widely advertised and that he naturally assumed, by virtue of the education he has received in advertising, was a good product. If it was not a good product it would not be advertised; it could not be advertised. In fact, we have almost reached

The Jenckes Machine Co., Limited

Sherbrooke Montreal Cobalt So. Porcupine St. Catharines Toronto Vancouver Nelson

a point today where we will not buy anything unless it is advertised. See if that is not true in your own experience.

If this branding and labeling of producer were done, and it is being done, you know, by some, the architect and engineer is not going to take any chance on something he does not know anything about when he can get for the same price a material that he has every reason to believe is what is claimed for it. It is simply working along the lines of least resistance. Usually we pay more for these things, and the customer is perfectly willing to pay the extra price because he thinks he is getting more for his money.

When my client asks me about the Barrett specification roof it is the easiest thing in the world for me to say that that roof is laid literally on square miles of roof service. It is a national product, the result of years of experience of an enormous corporation that had developed this to the highest degree of efficiency. Barrett is a good roof, but I do not always use it.

There will be lots of good brands of lumber on the market, and if it costs more we will use it when its use is justified, and it is going to be a very happy day for the architect and engineer when he knows that branded lumber which he specifies will be used. And more than that: When he can say to his contractor that he believes that such and such a brand is perhaps a little better than somebody's else, and everything being equal, he would like to have him use it. That day is rapidly coming, I am very glad to believe, and when it does we will not have any more buildings with dry rotted timbers taken out at the end of three or four years, buildings that cost too much, buildings that are inadequate for their service. We will design timber buildings as we do steel, know what we want and know what we get, and will get it, and the producers and manufacturers will have the pride of manufacturing. I should dislike to be in a business where I had to turn out a finished product that could not bear my name.

There are a great many lines of manufacturers which produce their standard goods. These goods are sold on their merit and on the strength of the name behind them. Lots of these manufacturers, too, produce large quantities of unnamed materials and products that they never make any mention of. I do not believe they derive any great pride or pleasure from the production of such goods and I believe there is not a manufacturer here today who would not be proud to put his name on every single stick of timber that goes out of his mill. It makes no difference whether a man produces a stick of timber or a beautiful painting; the product is the result of his labor and deserves recognition.

Service and the Part it Plays

By W. J. Kessler

Service is unquestionably a factor of vital importance in securing and retaining trade. The touchstone is used to ascertain the purity of gold and silver. The touchstone to business success is "service." Service today forms the "big idea" that predominates throughout the most progressive institutions. Great public service corporations, of whatsoever calling, have been built up on "service."

A certain western retail lumber dealers' association maintains a department of "community development." It teaches the farmers in its territory how to live better and how to improve the surroundings of their homes and towns. It is not a wildly altruistic scheme, but is based upon sound knowledge that improvement in living conditions means improvement in trade. The lumber dealer is one of the first to benefit in the general improvement. We have here a concrete example of "service" rendered in a most scintific manner.

People pay for service and they always will. The world's greatest rewards are for those who serve, and the degree of their reward is in direct proportion to their service-rendering power.

In order to put ourselves in position to render the greatest service possible, we must select and instruct our sales force intelligently and carefully. We must select men who possess and know how to use grey matter. Let them know your plans and aims and keep before them everlastingly the important matter of "service." Give them all the information, assistance and encouragement within your power, and then back up their efforts with some good, live, up-to-the-minute selling help for the retail dealers. The manufacturer who will organize his business on this basis is taking another step in the way of healthy development and progress.

While the sales force whose efforts I have had the honor to direct is not large, we have aimed to make it efficient and "service" is our first consideration. If I had the selection and direction of a large force of salesmen, I would certainly insist first upon a personal interview. I would diagnose their references carefully; their personal habits and selling experience would be thoroughly investigated. I would insist upon their working in the office and yard a sufficient length of time to familiarize themselves thoroughly with every department of our work, so that they would learn just what we are able to do for our trade in the way of "service." I would see that they were put into intimate touch with the manufacturing, yarding, grading, shipping and office systems. All this time they would be absorbing quality points and selling talk. I would make them see and feel and finally experience themselves the earnestness and enthusiasm of everyone about the place. I would fill them up with everything in the way of information and instructions that experience has taught, and will be of value.

Study All Order Details

"Get the business" seems to be the wolf cry of the office and it is the wolf cry usually of the representative on the road. No string is left unpulled, no stone unturned to get the business. Now let us see what we do with the order when we have it. Following the successful efforts of the office or our salesmen in getting the customer interested, there is nothing more between us apparently for the time being than a simple little sheet of paper about 4 x 8 inches, and I sometimes fear that some of us consider it little more than that. I think that one of our great weaknesses is to treat these orders with too little consideration. Did you ever stop to realize that this order really constitutes a coupon bartered for by the prospective customer, and that this coupon is of vital importance, not only to the dealer who has favored you with this order, but to the prospective customer as well?

Alas, there are too many order takers who clip these coupons, send them in for attention; and what happens to them when received by the office? They are often hurriedly scanned over by the sales manager, who marks them O. K., turns them over to his assistant, who will acknowledge them with the coldest formality possible by simply filling in a few figures and attaching a few initials to a postal card acknowledgement. I think that in the everyday execution of our business, we are too prone to treat lightly the orders that we receive. The fact remains that this order constitutes a contract as between buyer and seller, and that the exact fulfillment of every stipulation at once becomes a matter of utmost importance, touching directly on the honesty and integrity of the seller.

I think that an order form should be drawn up in such a way that it conforms to our ideas as nearly as possible in the way we wish to conduct our business. These order forms should show every essential detail, such as date, order number, consignor, consignee, destination, routing, delivery line, basis of freight rate on which the stock is sold, when price covers delivery, or sold f.o.b. mill, if necessary to invoice in duplicate or triplicate, where invoice is to be mailed, and last but not least, the terms of payment. Here it is where we are all weak. There is unquestionably less thought given to any perequisite on the order. The entire sales organization mechanically reasons that a given order comes from 60-2-15 territory; and so it is written, if at all.

It is unnecessary for me to go into any lengthy discourse of the grief resulting from careless attention to this detail. I would say that the customer has just as much right to change the price of lumber, remitting less per M than we agreed on, as he would to deduct discount after the discount period has expired; and I want to say that right here is room for concentrated action in establishing uniform terms covering all sales, regardless of the distance from point of shipment to point of consumption.

Proper Attention to All Data

When an order is received and it complies with our ideas with reference to the foregoing data, no less important is proper attention to the details that follow.

First, we should read carefully all the items, and satisfy ourselves that we have the stock that the customer wants.

Second, are we in position to fill the order exactly as specified? If not, stop; do not take a chance by pitting your judgment against that of your customer, but get into communication with him immediately and explain just what you can or cannot do. An honest appeal to your customer will, nine times out of ten, bring his consent to such amendments or substitutions as may be safely recommended. If you cannot adjust such matters with your customer before shipping, it is a moral certainty that you cannot mutually adjust the situation after shipment has been made. Every order is worthy of a personal acknowledgment, and I have long ago dropped the printed postal acknowledgement idea.

Note Every Requirement

Great care must be exercised in the making out of your shipping ticket from the order. You must be very careful to see that these orders are made out plainly and legibly so that there may be no misunderstanding with your yard foreman and shipping clerk. Note carefully every requirement as to lengths and widths and show just the percentages that you want loaded on all items calling for mixed widths and lengths. This will enable you not only to keep your stock well balanced but at the same time follow out the wishes of the customer in this respect. I think in times of car shortages it is well to have a definite understanding all along the line as to just what items may be reduced in the filling of stock orders. We oftentimes order in a 40-foot car for a certain order only to be informed the next day that the railroad company has no 40-foot empties, necessitating the loading of a considerably smaller car, which oftentimes makes it

WHO HAVE IMPORTED NINETY PER CENT. OF THE CANADIAN PULP SUPPLIED TO EUROPE SINCE 1899.

impossible to handle the entire order as outlined. These matters are all very easily explained to your customer, and I think that attention to details of this kind leaves a good impression.

When the shipping ticket comes back to the office for invoicing, see that every detail on it has been complied with before pricing and invoicing.

Prompt Shipment a Desirable Factor

Prompt shipment undoubtedly constitutes one of the very highest forms of "service" that you can render your customer. I realize that we are not all in position to guarantee twenty-four to forty-eight hours' service, and I do not think it would be practical. Every concern knows its capacity and should be able to determine from day to day just where they stand in the matter of shipments. Under no condition make promise of shipment for a certain time unless you positively know that the car can be reached by that time. It is better to allow yourself from two to three days' grace in this matter, as you know that every once in a while a phone order or a telegraphic order must be injected into your line ahead of other orders, and will, of course, have a retarding effect on the balance of your orders.

We are all out after the business, but I think that this shooting ahead of orders should be studiously avoided as far as possible.

I think it is of the utmost importance to explain to your trade the exact condition that your stock is in with reference to dryness. Most of us are no doubt in a most deplorable situation at present in this respect. It may be all right for you to crowd out your dimension half dry, but I do not think that you should crowd out such items as ceiling, flooring, drop siding, shiplap, etc., in this condition, without a thorough understanding with your customer. A customer receiving stock of this kind is sure to be disappointed. No dealer likes to stick stock up outside of his sheds and rehandle it again after it has dried out sufficiently to pack away in his usually ill-ventilated sheds.

We are spending a lot of money in promoting the sale of "Old Faithful," so let us see that we ship our lumber in the very best manner and condition possible.

So here we have the touchstone that we are seeking—"service." It predominates throughout the entire fabric of merchandising. We have a commodity whose use will make our neighbor a better man. Then we have the foundation of a legitimate business. How can you sell it to him? Why, by "service," of course. Develop its primary "service" rendering power, show its immediate value. Train your salesmen to serve your trade not only the immediate sale of your lumber, but in every other way. Compel your merchandising to serve both in its immediate sale by developing a deeper secondary power.

The spirit of "service" is bound to bring success, whether you spell success with a dollar mark or not. It is simple and easy, and there are a thousand and one ideas all developed that await only the application of this wonderful touchstone of success to their marketing to make profits. To those who have this vision, there is more than profit, there is an opportunity to contribute to the progress of their generation.

Employer and Employee

By H. G. Kistner, Logging Engineer, Portland, Ore.

To say that closer relations between the employer and employee are eminently desirable, is to repeat a platitude, and that it is the desire of every operator goes without saying. And yet, notwithstanding all the discussions we have had on the bonus system, efficiency in operation, etc., and in spite of the examples of fine camp equipment that the more progressive operators are installing, the personal factor of the logging employee is given too little consideration.

It is generally conceded that man for man the average woods worker is of a higher type than any other out-door worker and yet, with all the resources in brain power that this body of men represent, all that the logging industry is receiving from them is their day's work performed in the same way their predecessors did it. Certainly they give value received for their wages and usually good value at that, but that is where the average man stops. And that is where the employer ought to begin to utilize the reserves of his men.

For instance, when a new logging device is wanted—a special rig for overhead logging or some difficult problem is to be met— too often the problem is put up to your machinery house, and their engineer, being told in a very general way what you want to do, is expected to turn out a solution off-hand. No matter how well the engineer is versed in mechanics, or how good a designer he may be, he is not a practical logger, and to secure the best results it is up to you first to give him a good working plan. It is the purpose of this article to try to show how you can get the most out of the material with which you have to work—in this case the genus "logger"— and how you can attempt to solve some of your own problems before you turn to the mechanical engineer.

The mental capacity of the logger is tested every day in meeting new problems, and he does meet them ingeniously, but why not go further than this and utilize their ingenuity in a co-operative way? We all know about the great strokes of logging that are done evenings in the bunk houses, and any man in camp can tell you how he would run the thing if he were boss. We put this down as mostly "'hot air," but how about it, can't we sift out the wheat from the chaff and occasionally get a valuable idea from a new source? If you operators can show the men that you have a real interest in them and give them a reason for having a personal interest in you, and in your operations, you will go a long way towards solving efficiency problems.

Experiment number one: announce that a series of small prizes will be given each month for the best suggestions offered pertaining to greater efficiency in logging camp work—these suggestions might cover a wide range; from fire prevention to cook house improvement and camp sanitation. An "efficiency box," for receiving these suggestions, should be placed in every camp. It would be well to provide that at least five suggestions in all must be received in a calendar month, or they would be carried into the next month. It would also be advisable, in order to insure fairness and freedom in discussion, to use a system of numbering the suggestions, having the name of the author in a corresponding envelope bearing the same number. About the fifth of each month, have the men gather in the cook house, or the Y. M. C. A. building, if there is one, present the suggestions, have a general discussion and let the men decide by vote whether the ideas presented are of enough practical value to merit prizes, and which ones are the best.

The superintendent can afterward adopt these suggestions as he may see fit, but the popular decision will do much to stimulate the men's interest and avoid charges of its being "another company scheme." It should be needless to say that to expect the men to turn out and take an interest in the discussion, the gathering must be entirely informal, and, if possible, have the men run it. If, in every camp, one really valuable idea can be put into effect, the experiment should be well worth trying, and will undoubtedly result in the men taking a greater interest in their work and in getting a better idea of the operator's viewpoint.

The National Cash Register Company—one of the most efficiently managed establishments in the country—years ago adopted this plan and a large part of the improvements in their wonderful machines are directly due to suggestions of their employees, and no suggestions made are passed over without being given a thorough test.

The greatest handicap of the average woods-worker is his lack of sufficient educational advantages—then supplying this lack, in even the smallest degree, would be the biggest boost you could give him. Give the men a chance to learn the things they need—many a man of real ability will be found ready and anxious to take advantage of the long evenings that are ordinarily wasted. Start at the very bottom of the educational ladder and offer them first a class in the "Three Rs"—from the young men who are interested in this and others who are further advanced, an elementary school could be formed to give them the rudiments of practical logging engineering. There is no question about finding men of ability, it is just a matter of bringing out the latent resources—organize the work along practical lines and when the men find out what you are doing, there will be no lack of interest.

The old-time woodsman was much more familiar with land subdivision than the present-day logger—let them have all the knowledge possible along that line; a great many don't even know how to run a compass line—that is a practical and valuable accomplishment for any man in the woods; the question of railroad grades may be taken up and the best methods of clearing right-of-way; economical use of stumping powder; weights of steel best adapted for main line and spurs, and comparative costs; the question of a supply of ties—best and cheapest; costs of wire rope; maintenance costs and depreciation of donkey engines—and a multitude of other questions which will inevitably present themselves. The leaders of the class—superintendent, foremen, logging engineer, etc.—would be benefitted as much as the men, and from this should come a regular discussion meeting where each department can bring its problems.

There is no reason to doubt that from all this will come a better understanding between the employer and employee, greater interest and, consequently, greater efficiency, valuable ideas for improving logging methods, and a new corps of logging engineers from the young men who have developed a desire for more knowledge from the new outlook you have given them.

Special Heavy Sawmill Blowers

The Toronto Blower Company, 156 Duke Street, Toronto, mechanical engineers and manufacturers of blowers and blower systems, have made several successful installations recently of their special heavy sawmill blower, which is specially suitable for the Canadian sawmill trade. The firm manufacture everything required in the installation of a modern exhaust system, including improved automatic furnace feeders, special hoods for woodworking machines, and slow speed, low power exhaust systems for removing shavings, sawdust, emery dust, lint, smoke and odors. The company will send their engineer anywhere in Canada to estimate on any proposed installation.

Why An Aloxite Saw Gumming Wheel Cuts Cool

ALOXITE is tough—it has just the proper temper to keep the wheel with a free cutting face.—The wheels are of an open or porous nature, thus allowing the free action of the grain. —A close bonded wheel drags—creates friction—friction means heat. Aloxite wheels cut cool, free, fast—they don't fill—they produce no unnecessary friction—they work without rasp or screech—hold their shape—show long life.

EDGINGS

Ontario

The Western Canada Stave Mill has started cutting at Rainy River, Ont., and will put out over 3,000 barrels per day. This means turning out over 60,000 staves daily. W. H. Green, the manager, says they will also have an up-to-date sawmill erected at once.

The National Wood Manufacturing Company, Limited, has been incorporated with head office at South River, Ont., and capital stock of $125,000, to carry on business as manufacturers of lumber, timber, pulpwood, etc. Those interested are W. J. Ard, C. A. Jackman, A. Howard, W. A. Connolly, and others.

The Elmira Planing Mill Company, Limited, have been incorporated with head office at Elmira, Ont., and capital stock of $40,000, to carry on business as lumber dealers, planing mill operators, sash and door manufacturers, and manufacturers of lumber products. Those interested are W. J. Letson, J. Bauman, E. G. Martin, A. Eby, J. McMillan and N. M. Bearinger, all of Elmira, Ont.

The Cleveland Sarnia Sawmill Company has a gang of men at work in the bay building a large number of log booms for containing the new rafts of logs that are already on the way down the lakes in tow of the Reid tugs. Last summer the booms of the rafts in the bay broke under the heavy strain of a rush of water, and about 70,000 logs went down the river. The company is adding the new booms as an assurance that the boom will not be found wanting in the future.

Eastern Canada

Josephat Lemoureux, Massueville, P.Q., sawmill operator, has been registered.

Fire recently destroyed a considerable quantity of stock belonging to Robert Neville, Outremont, P.Q.

The Pejepscot Lumber Company, Great Salmon River, N. B., are commencing to rebuild their mill which was destroyed by fire last November.

Price Bros. & Company, Limited, Kenogami, P. Q., have commenced work on an extension to their paper mills. The new building will contain two paper machines and will be about 75 x 200 feet. The architect is A. Whipple, Quebec, P. Q.

The Ha Ha Baie Sulphite Co. of Chicoutimi, has awarded a contract for the construction of a paper pulp plant at Bagotville, to the J. G. White Engineering Company, of New York. Work on the site, which is on Ha Ha Bay, on the Saguenay river, and which will occupy about five acres, has been begun, and it is expected that the plant will be producing pulp early in 1917. J. E. A. Dubuc, president of the North American Pulp & Paper Co., and general manager of the Chicoutimi Pulp & Paper Co., will be head of the new company.

J. McD. Grosart, who for the past 17 years has been a member of the staff of Price Bros. & Co., Ltd., Quebec, P. Q., has joined with Ernest Tremblay and Henri Gauthier in forming a company under the name of Grosart Limited, who will carry on business as contractors, merchants and agents with headquarters at Chicoutimi, P. Q. The company have secured a five years' contract with the Mattagami Pulp & Paper Company of Toronto and Smooth Rock Falls, Ont., and will take out all the pulpwood logs used by the Mattagami Company for the operation of their plant.

Western Canada

The Alberta Lumber Company, Calgary, has increased its capital stock to $250,000.

The Beaver Lumber Company, Limited, Winnipeg, has bought out the International Mercantile Company, Limited, of Wymark, Sask.

The old Symons sawmill near Nakusp, B. C., is being remodelled and will soon be in operation as a shingle mill, with an equipment of three machines.

The Morehart-Broderick Lumber Company, of Saskatoon, has sold its yards at Empress and Estuary, Sask., to the Imperial Elevator & Lumber Company, Winnipeg.

Edward Norton Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $10,000, to carry on business as manufacturers of and dealers in lumber, timber and shingles, etc.

A new shingle mill will be built shortly at Queensborough, B.C., by Mr. Warren Blyth, of Vancouver. The mill will be a small, but well equipped one and may be enlarged subsequently when trade increases.

The Sylvania Logging Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $30,000, to carry on

business as timber merchants, sawmill proprietors, wood pulp manufacturers and to deal in timber and wood of all kinds.

The equipment of the Port Moody Shingle Company's mill on the Pitt River, B.C., has been improved by the installation of a large engine with a capacity for operating eight machines. Several new machines have also been installed. The plant is being run day and night.

Walter Whiteside, of Duluth, Minn., has purchased the shingle mill operated by Kinney & Woods at New Westminster, B. C. The equipment of the plant will be increased and brought up to date. It is possible that Mr. Whiteside will also build a sawmill adjoining the shingle mill.

The Brunette Saw Mills Company, Limited, New Westminster, B. C., are putting in a new dry kiln for their shingle mill, to replace one that was recently destroyed by fire. They are also making extension to their sorting tables. Another new dry kiln, for the sawmill section of their plant is now nearing completion.

The McNair Timber Company, Limited, has been incorporated with head office at Victoria, B. C., and capital stock of $45,000, to carry on business as timber and lumber merchants, sawmill owners, etc., and as manufacturers and dealers in pulp, paper, lumber, timber, shingles, lath, sash and doors, portable houses, boxes, etc.

Sealed tenders are being received by the Minister of Lands for British Columbia, until June 21, 1916, for the purchase of License X25, to cut 1,920,000 feet of fir and cedar, on an area adjoining S. T. L. 38431, Johnston Bluff, Calm Channel, Coast District, Range 1. Two years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for B. C., until June 21, 1916, for the purchase of License X616, to cut 1,040,000 feet of fir, cedar and hemlock and 9,000 lineal feet of cedar poles on an area situated on the west shore of Hotham Sound, New Westminster District. Two years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until July 26, 1916, for the purchase of License X90, to cut 7,130,000 feet of Douglas fir, hemlock, cedar, white pine, and balsam fir, and 535 cords of shingle bolts on an area adjoining Lot 115, Sydney Bay, Coast District, Range 1. Three years will be allowed for the removal of the timber.

The Straits Lumber Company, Limited, has been registered as an extra-provincial company with head office at Janesville, Wis., and provincial office at 519 Metropolitan Building, Vancouver, B. C. The capital stock of the company is $1,100,000. Rufus H. Roys, Vancouver, is attorney for the company. The objects of the company are to buy, sell, deal in and manufacture timber, lumber, logs, etc.

New Woods Making Good Paper

That satisfactory wood pulp can be made from a number of heretofore little known woods is evidenced by a United States Government publication just issued, which contains seventy samples of paper manufactured by different processes, chiefly from woods heretofore practically unused for this purpose. It is pointed out that the spruce forests of the country are threatened with exhaustion and that the cost of spruce pulpwood has steadily increased. If the price of newsprint paper is to be kept at a reasonable figure, more efficient methods of converting spruce into pulp must be developed or cheaper woods substituted for it, the report says.

The bulletin states that the method of manufacturing groundwood pulp has changed very little since its introduction into the United States in 1867. It was with the idea of developing new methods and improving the old, that tests were undertaken at the Forest Service laboratories at Wausau and Madison, Wisconsin. As a result, the relation of the different steps in the manufacturing process to each other has been definitely established and the merits of each treatment determined. The paper made from new woods was given a practical trial by two large newspapers with satisfactory results.

The tests showed that eleven new woods give promise of being suitable for the production of news print paper, while a number of others will produce manila paper and boxboards. Most of these woods are confined to the west, while the groudwood industry now obtains the bulk of its raw material from the east. It is thought that pulp-making plants must eventually move to points where they can obtain a plentiful supply of wood and an abundance of cheap water-power, two prime requisites in the business.

The report says that because the National Forests of the United States contain immense quantities of the suitable woods and abundant opportunities for power development, they will undoubtedly play an important part in the future of the wood pulp industry.

Moved to New Quarters

Taylor and Arnold Ltd., Sales Agent, Montreal and Winnipeg

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa,
December 20th, 1912.

Deputy Minister.

Why Experts Are Needed

When installing a fan system for handling shavings, the fan is not the only consideration. The layout of piping, and the sizes of main duct and branch pipes are equally important.

Although it is easy to install a system that will work, such systems are frequently very wasteful of power and only experienced engineers are qualified to design systems that will keep the operation costs down to a minimum.

Sturtevant
Trade Mark

Fan Systems

are laid out by experts and their design is influenced by a wealth of experience. In some sections of the country, where it is more to your advantage, we will refer your inquiry to thoroughly experienced contractors and you cannot afford to deal with others.

Dictate a letter now, detailing your conditions.

INCREASE OUR BUSINESS BY PROMPT DELIVERIES

THE Prasse Lumber Company, of Cleveland, uses two Packard chainless motor trucks, fitted with special roller bodies for quick loading and unloading, for retail delivery. C. G. Prasse gives Packards the following recommendation:

"Motor trucks cost no more to operate than do horses and they please our customers by giving more prompt delivery. Everyone expects motor delivery these days. We have been using trucks for about three years and recently decided that Packards were the best for our work.

"Though we still use horses, I should like very much to do away with them entirely, as I suppose they will eventually be replaced by machines."

There is a Packard truck for every requirement of the lumber business. For light loads the Light Service Trucks, rated respectively at 1—1¼ tons and 1½—1¾ tons, provide quick, on-time delivery. For heavier loads there are five sizes, 2 to 6½ tons' capacity. Optional frame lengths and body styles make Packards adaptable to every kind of material.

GOODHUE BELTING For

Saw and Planing Mills

In a Goodhue Belt you get only the best leather with the stretch taken out of it. A Goodhue Belt will always run evenly and "clings" to the pulley transmitting 100% of your power.

For the wet places in the mill we have a special waterproof leather belt—"Acme". Other Goodhue Belts are "Extra" and "Standard" recommended according to the conditions under which the belt has to run.

Goodhue Belts stretch less than any other belt by 15 to 25 per cent.

The Time to Invest in Timber is NOW.

We can take advantage of market conditions for you as you cannot for yourself.

Either of two systems may be followed in buying timber. One contemplates buying properties at recognized market values to accord with individual ideas as to what a timber tract should be, and hold it in anticipation of steadily increasing value; the other, the Lacey Way, contemplates taking advantage of opportunities that come to an organization like ours, buying at prices much below recognized values and gaining profit, both from the purchase and from accretion.

Obviously the latter plan is most inviting from the standpoint of speculation, or for those who do not contemplate future manufacturing. It permits carrying charges to be reckoned merely as deferred payments on the purchase price, and of course means larger profits.

The present is a most opportune time for such investments. After a period of depression, in common with other industries, lumber is coming into its own again. There are, however, many timber owners, financially unable to carry non-productive investments, who must sell.

We can make a selection for you in the Douglas Fir forests of British Columbia, Washington or Oregon; the White Pine of Idaho; the Western Pine of Oregon or California; in the Redwoods of the latter state or elsewhere. Prices range well below the market values. Send for further information and booklet described as "Pointers."

FIRE BRICK

Differs in Quality and Variety

For instance, a certain quality or kind of brick that gives satsatisfaction when used in a Refuse Burner, may show up poorly if used in a Dutch Oven.

It all depends on getting the right kind and the right quality for your particular needs.

Just tell us what you want it for, and we'll send a firebrick that was made for that very purpose.

We Manufacture the Following Well-Known Brands

"Elkco" "Elk Steel," "St Marys," "Keystone" and "Rotex"

INDUSTRIAL LOCOMOTIVES

A locomotive to justify its cost must start the required load and keep it going.

The right amount of the right material must be provided in the right place.

Each and every part must be sure to fit not only the locomotive for which it was made, but every other locomotive of the same size and design. Spare parts must be instantly available, made so well as to go into place without a machine shop.

We have a number of standard sizes of locomotives in stock and can make immediate delivery.

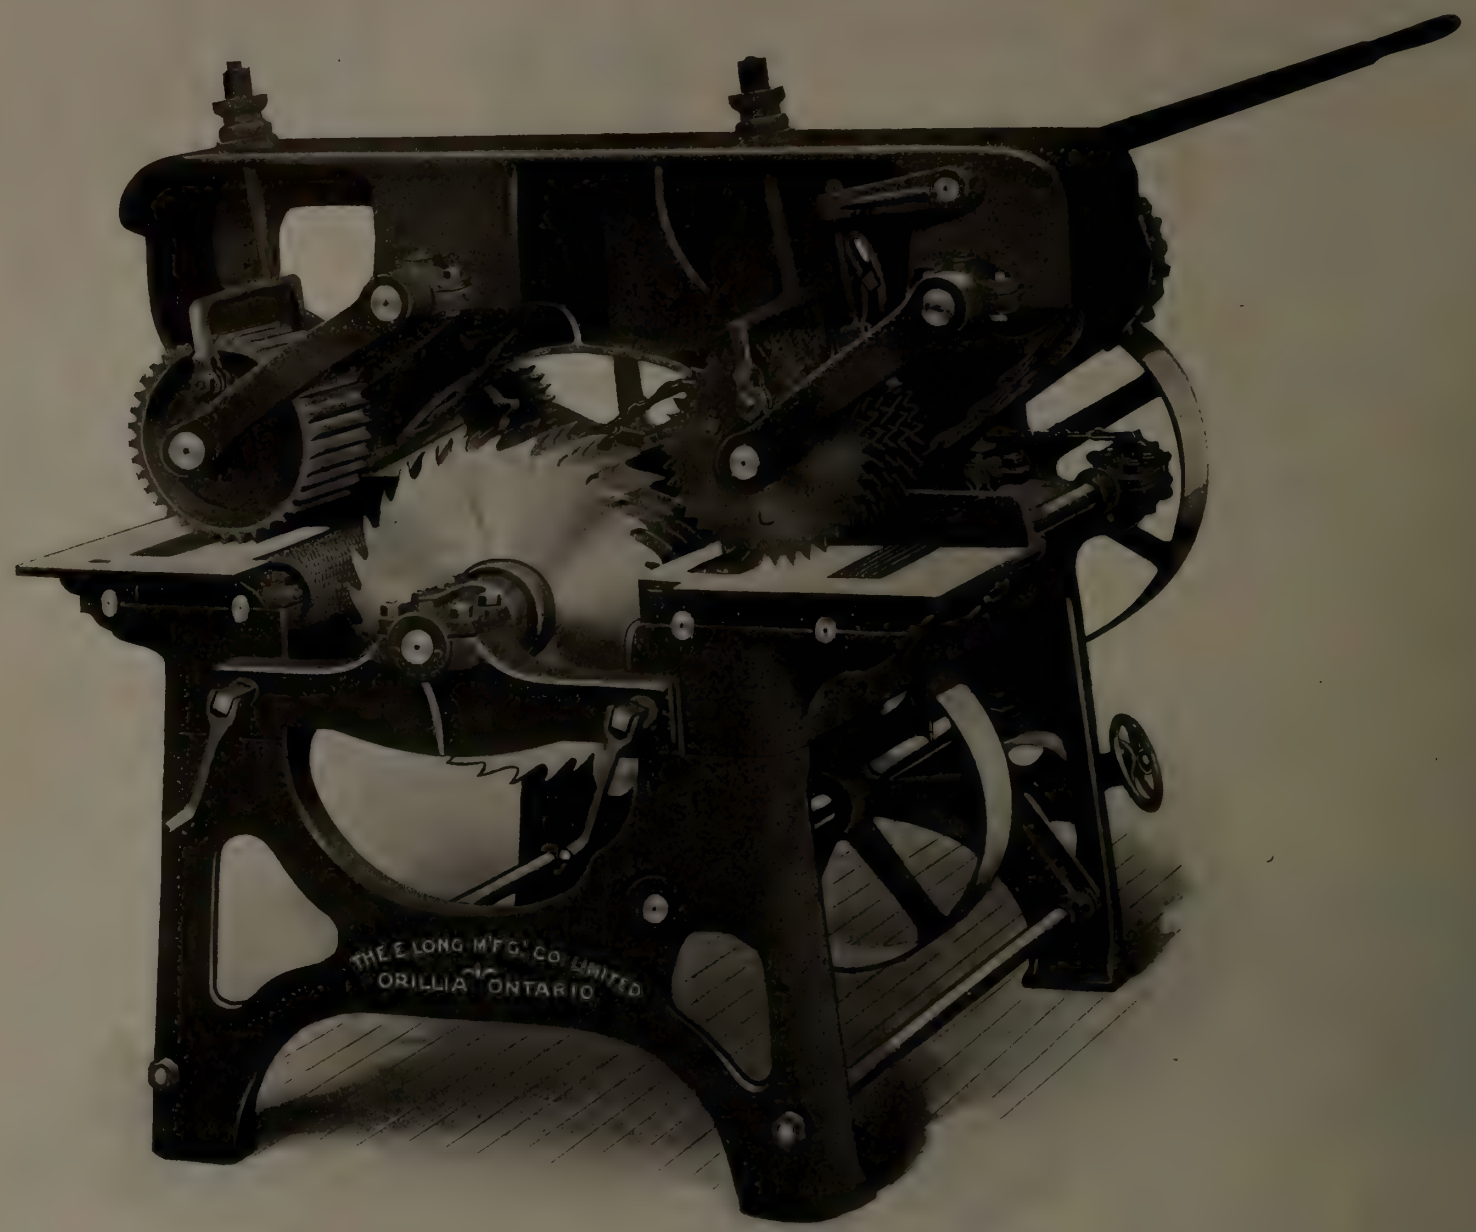
CLIMAX MANUFACTURING CO., 313 W. Main Street, CORRY, PA.
VANCOUVER MACHINERY DEPOT, LTD., VANCOUVER, B.C.



No. 3 Bolter

One of the main reasons for the great popularity of our No. 3 Bolter is its capacity for continuous work.

The machine is so substantial in all the essential parts—frame, bearings, etc.—that you seldom see the slightest trouble develop.

Another reason is the uniform, accurate work turned out under all conditions. In large mills where they produce large quantities of lath, etc., our No. 3 Bolter is almost universally used.

The machine has our usual one-piece frame construction, with all bearing and working parts easily accessible for adjustment, etc. Carries four 20-inch saws, spaced ordinarily for lath bolts, but can be arranged for any spacing of saws for cutting slats, pickets, etc. Floor space, 5 feet x 4 feet 6 inches; weight, 2,800 pounds.

Send for detailed description and dimensions.

Catalogue No. 102

The E. Long Manufacturing Company

Orillia **Limited** **Ontario**

Throw Out Those Old Valves!!

Don't tolerate kicking or leaking valves on your Steam Feed. Just as sure as your valves kick, your cutting capacity is going to take a drop. The Sawyer "feels" his work through his lever. A kicking valve scares him off his work; a leaking valve won't let him do his best. Both kinds are money losers for you.

WATEROUS VERTICAL STEAM FEED VALVES

Will neither kick nor leak

In the first place, the vertical position of this new valve allows perfect drainage into the exhaust port at the bottom. Should the connection break the valve drops of its own weight and shuts off the steam. That's a ***safety*** feature.

Then, the exhaust—mostly water—doesn't pass through the valve plug, but through the lower part of the valve chest. That's why the valve ***cannot kick.***

And—most important of all—with the vertical valve there is no weight on the valve seat and consequently ***no wear*** and ***no leakage.*** It's a ***real*** steam conserver.

Further, the **Waterous Vertical Valve** is balanced to work easy, there is no dead steam between it and the cylinder. Just as soon as the sawyer moves his lever he gets the full "punch" of the live steam on his piston. That makes a ***fast, quick-acting, satisfactory feed.***

If yours isn't that kind now, attach **Waterous Vertical Valves** and see what a difference they will make.

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. **Price 30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

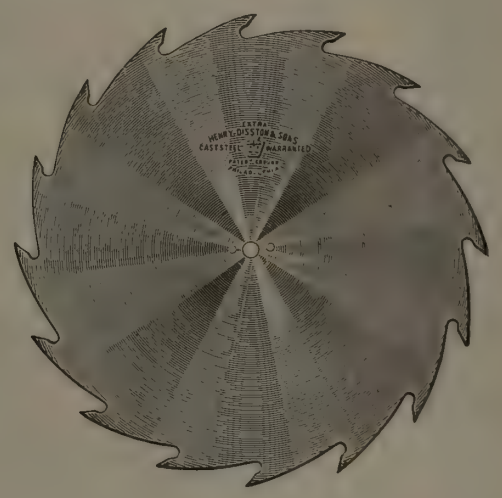
DISSTON SAWS

have been made from steel made by us in our own plant since 1855. More than sixty years experience in the manufacture of saw-steel coupled with a study of operating requirements extending over three quarters of a century have resulted in saws of highest excellence.

In tension—, set—and edge-holding qualities Disston Saws are as near perfection as the world's foremost saw-makers can make them.



Where quality means economy, the proper test is service.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, July 1, 1916 No. 13

The Canadian Forestry Battalion

One of the most interesting features in connection with the formation of a forestry battalion in Canada recently, which went over to England to assist in cutting standing timber for use in connection with the war, and the further raising of two additional similar battalions, which is now in progress, is the fact that among Canadian lumbermen the matter was taken up with great enthusiasm from the very first and put through with wonderful expedition. There was not one single word uttered, so far as we have been able to ascertain, which would indicate anything in the nature of criticism, and there has been an entire absence of personal consideration and a unanimous co-operation to assist in raising these battalions, in spite of the fact that they have taken out of Canada a large number of skilled woodsmen, and have enabled the Imperial authorities to secure large supplies of timber in England which would otherwise be imported from Canada. The patriotic aspect of the situation is the only one that has been spoken of by Canadian lumbermen, and those who are engaged in the lumber business in Canada have reason to feel gratified with the splendid Imperial spirit which this situation has shown. It is indeed remarkable that there has not even been any discussion of the interference with the industry in Canada which the raising of these battalions has brought about, but only expressions of enthusiastic pride in the fact that the lumbering industry has been able to be of such definite and valuable assistance to the Empire.

For this reason we are glad to be able to publish, elsewhere in this issue, the remarks made by Mr. Acland (parliamentary secretary to the Board of Agriculture) in the British House of Commons recently, when referring to the work of the Timber Committee. Many kinds of labor had been employed, Mr. Acland reported, in connection with the cutting of home grown timber in Great Britain, "but of all these different sources, by far the most useful and valuable have been the Canadians. I cannot express to the Committee the energy which was shown by the Government of Canada, since the matter was put before them, and by the officers whom they appointed in raising a forestry battalion, which has come over here to work in our woods. The Government and the people of Canada are naturally interested in their own timber, but they realized that the position of the Empire as to freight was so serious that we could not now be expected to supply our needs from Canada if it were possible to supply them here at home. They have shown a true Imperial spirit in helping us to supply them in the most practical manner possible. The only difficulty will be to keep these men with big enough blocks of timber to cut."

This is a fine appreciation of the practical assistance given by the Canadian lumber industry, and should make the lumbermen of this country feel a glow of patriotic pride in having been able to take part in so practical a work. That the difficulty in finding enough timber to keep these men busy has been overcome, seems to be illustrated by the fact that two more battalions have been called for and are now in process of formation in Canada.

Can the Public be Taught to Use More Lumber?

It is interesting to compare the subjects that receive the largest amount of discussion at Lumber Association conventions in the United States and to see, not only how they are handled by the speakers, but how they indicate the direction in which the trade winds of the lumber business are blowing.

A few years ago, we heard more about co-operation among associations than anything else. These were the days when some of the largest associations in the United States were being investigated by the governments, both of the United States and some of the individual States, for the purpose of finding out whether their activities were strictly legal. The results of these investigations are well known. They led, in one memorable case, to an important association being found guilty of various infractions of the State law and being compelled to disorganize, while its individual members had to pay pretty substantial fines. The merits of this matter are not of much interest today. What we are interested in is that it was not long before the members of the same association worked out a far more efficient and valuable organization which has made them of even greater influence in the trade than they ever were before.

At one period, a few years ago, we had an example of association work going the limit, when the Lumber Trades Congress was conceived and brought into existence, which for one reason or another lived only for a few years. We had also a Wood Products Exposition which was held at Chicago and New York and drew widespread attention to the value of wood as a building material. All these events, though they may not appear at first to be intimately related, have been more or less connected with one another, and have been steps in the development of a more practical usefulness for lumber associations.

Another line of discussion, quite definitely related to all these matters, is that which has been devoted in ever increasing measure to what we have come to understand by the word "service." The changes have been rung upon this subject interminably, until some lumbermen must be sick and tired of it, but the general effect has been good. Many firms that were going along in their own quiet ways have been stirred up to a fuller appreciation of the importance of increasing and improving their businesses and at the same time being more useful to their customers.

Throughout all these discussions and developments there has been working out automatically, and to some extent even without the knowledge of those engaged, a gradual approach towards something astonishingly simple, once it has been brought to the attention of the trade, and yet something which has been altogether neglected during the past, namely; the great possibilities connected with advertising lumber to the consumer. In the first place the association movement seemed to spend most of its force in an effort to organize lumbermen in such a way as to limit production so that it would not run ahead of consumption. It was thought that this would surely result in good prices being secured for all the lumber produced and that everyone would then be prosperous who manufactured or sold

lumber. There was a flaw in this theory which was not perceived at first, but which soon became clearly evident, namely; that it neglected to consider the consumption end of the business at all. Keeping down production is, to a certain extent, a wise course, but when it is not coupled with some plan for keeping up consumption at the same time, there is likely to be trouble.

Lately, the consumption end of the problem has been getting a fair share of attention, and it has been discovered that keeping down production without paying any attention to consumption is almost a waste of time, for the substitute man is abroad in the land and is sitting up nights working out schemes for keeping down the consumption of lumber so that his own products may sell the more widely. So it happened for a time that the lumber organizations were limiting production and the substitute manufacturers were restricting the consumption of lumber, and between the two the business was in a worse state than ever before.

It was the logical result of the campaign for the restriction of output that someone should begin to think about keeping up the consumption and should first of all look into the possibilities of advertising. No sooner had this been looked into than its merits commenced to be recognized. We now believe that advertising lumber has come into existence in the United States for keeps. Unquestionably, a great interest is being taken in the matter by manufacturers and we hope to see the movement spread until the ordinary reader has become as thoroughly saturated with information about the merits of different lines of lumber as he has been with information about the merits of the different kinds of automobiles, talking machines, safety razors, clothing, and of cement, tile and other substitute building materials.

Here are a few of the bright things that have recently been said about this advertising situation, by the National Lumber Manufacturers' Association:—

The cement interests are spending $750,000 to make the lumber business trail the cement business. Do you want to be a trailer?

No other structural material is marketed with so little intelligence or with so little regard to the interests of the consumer as is wood. Who is to blame if he uses substitutes?

Many of the city building codes are unfair to wood. Did you ever think about this?

Is your sawmill of cement and steel or mill constructed with a sprinkler system? What kind of a house do you live in?

Oysters are trademarked; why not lumber?

The manual training schools are begging for information about wood and suitable material to work with. How long would they have to wait if they wanted a substitute material?

If the architects see eight times as much advertising for metal doors as for wooden doors, who has a wooden head?

The manufacturers of safety pins spend more money annually in advertising than the lumbermen do. Think of being below the creeping stage.

Within a very few years the public have been educated to buy "advertised goods." Are they buying yours as they can be taught to?

If you asked a clerk the price of a collar button and he told you $17 a gross, you would think he was crazy, wouldn't you? Well, how much is a thousand feet of lumber?

No Change in Hardwood Inspection

The refusal of the National Hardwood Lumber Association to change its inspection rules, as reported in the account of their annual meeting, elsewhere in this issue, is a matter of the greatest importance to the hardwood trade, both in Canada and the United States. We have refrained all along from commenting on the situation, either pro or con, and have been satisfied with printing the views of members of the Association, leaving it entirely to the Association to fight its own battle. Now that the battle is over and the majority of members of the Association have seen fit to leave the inspection as it was, we feel that we are more free to express our own views upon the subject.

The Canadian hardwood trade have been slow to adopt the rules of the National Hardwood Association and to make them universal throughout Canada, but it has now been pretty thoroughly demonstrated that these rules are the only workable ones available. The Canadian trade had in the end come largely to observe these rules, and had educated the consumers of lumber to doing business upon this basis. The result was that most of the troubles arising out of inspection had been eliminated. This was the state of affairs when the proposition came up to make a change in the rules. To Canadians it looked as if this change would tear away the foundation from under the hardwood trade and leave them in practically as disturbed a position as they were in before the rules began to be used in this country. In our opinion such a change would have given the hardwood trade in Canada a set back of one or two years. There would undoubtedly have been a great turmoil growing out of the changed rules, and it would have taken a long time for the disturbance to settle down.

Changes in the direction of improvement are adways a good thing, but we deem it a question whether the changes that were proposed would have been in the form of improvements. In the first place, they were the most radical changes that had ever been proposed in the National Hardwood Lumber Association. They would have done away with inspection from the poor side of the board and substituted for it inspection from the good side of the board, irrespective of what the other side of the board might show. As a simple matter of business honesty this does not seem to us to have been a proper principle. It appears to be practically on a par with the old-time practice of placing the best berries on the top of the box, a practice which has been so generally denounced that governments have legislated against it.

It must not be lost sight of that, although the National Hardwood Lumber Association is a body of dealers and manufacturers of lumber interested largely in the development of their own interests, they may also want certain things in connection with the handling of their business and may find it important to consider the rights of the trade to whom they are selling, who have to re-manufacture the lumber. It was stated by some of those in favor of the changes, at the convention, that it was the universal demand of the manufacturer for these changes that caused them to be drawn up and proposed, but it was pretty thoroughly proven during the debate upon the question at the convention that it is doubtful if there are very many consumers who wanted these changes.

The chief point of objection brought forward by those who opposed the change was that it is not possible to legislate value into lumber. The changes appeared to them to have this idea in view and to be an attempt to dictate to the consumer what class of stock he should buy. In taking such a stand the Association would have been undoing most of the good work it had performed in the past. It would have deprived itself of the important position it has secured as an arbitrator. There are three classes of people for whom the services of the Association as an arbitrator are valuable:—First, the man who makes the lumber and owns the stumpage; second, the wholesaler of lumber, who is just as necessary to the Association as anyone else, and third, the man who uses and consumes the stock. Any rules for the grading of lumber can only be successful when members of the Association are prepared to be fair minded and give a square deal to each of these component parts of the organization. It is impossible for any manufacturer to say, "I make this lumber, it is my own and I will sell it any way I see fit." It is equally impossible for the consumer to say, "I use this lumber and I will tell the manufacturer exactly what I will buy and what I will not buy." The work of the Association is primarily to bring these two opposed parties together in the most businesslike manner possible. This can only be done by the members of the Association working in unison under the rules which have now been in force for some time. This object has been obtained very successfully and we believe that if

the proposed changes had been put into effect, adding to the number of grades and introducing a great element of confusion in the inspection, it would have been impossible to work out anything like as effective a result as had been previously secured. When one considers that the chief purpose of the Association is to furnish inspection according to a set of standard rules he can scarcely conclude that the proposed changes would have been anything but fatal to the life of the Association itself.

In Canada we need hardwood grading rules perhaps more than the trade in the United States needs them. Manufacturers in Canada have unfortunately been very largely what is known as "price buyers," and for that reason they have required the protection of a standard set of inspection rules. Without such rules a "price buyer" stands a splendid chance of being trimmed in business. If he is educated on the line of good uniform grading rules there is far less likelihood of his suffering in this manner. We believe that the confusion which would result from the increased number of grades under the changes that were proposed would have encouraged that undesirable element of the trade which is here today and gone tomorrow, and is always seeking to take advantage of the uncertainties that may develop out of misunderstandsing about grades. In short, it is our conviction that the changes would have provided far too many opportunities for the man who likes to manipulate his grades, and we are glad to learn that the proposed changes have been defeated, and doubly glad because one of the most active opponents to the changes was a prominent member of the hardwood trade in Canada.

Association Work a Great Trade Benefit

The tendency on the part of retail lumbermen to take steps in the direction of protecting their trade from the competition of manufacturers or wholesalers who think they have a right to sell direct to the consumer is becoming more and more pronounced. Whether this is an indication that the necessity for such protection is greater now than it used to be is open to question. We prefer to think that it is an indication rather of the fact that the retailer is realizing more than formerly the importance of co-operative action, and is looking more closely into its effect and into the general question of trade ethics than he has been in the habit of doing in the past.

Every now and then one hears of the existence of a little association of retailers covering a well-defined locality in which the dealers are doing what they can to see that their trade is protected. The idea behind such a development is a reasonable and businesslike one, so far as we are able to understand it. It is simply an expression of the old truism, that in union there is strength, and is based upon the idea that one good turn deserves another, and vice-versa, one bad turn makes it necessary for the victim to take some radical step to avoid a second one of the same kind.

Take, for instance, the simplest form of co-operative protection by retailers, that of reporting firms of manufacturers and wholesalers who are selling to the consumer, so that in future the retailers may make it difficult for the invader to obtain trade in that district by refusing to buy from him. At first sight this looks to some suspicious persons like a combination in restraint of trade, but in reality it is a combination for mutual protection against a variety of business which most people have come to consider as a form of trade piracy. Reciprocity is really the keynote of successful business methods. Reciprocity in service is what we mean.

We have sometimes heard manufacturers and wholesalers who imagine that they have some grievance in connection with their trade, say that they intend to go direct to the retailer or the consumer and to show the wholesaler or the retailer that they are not dependent upon them for business. We have several times heard retailers talk about wholesalers delivering a car load of lumber to a large consumer in their territory and then claiming that because it was a large quantity they were quite justified in passing over the retailer. To the limit of our ability we have tried to discourage this sort of thing. So far as our own information goes it leads to only one thing, and that is definite loss of trade to the offender. The retailer who is a victim of this kind of competition is surely justified in joining with his fellow retailers to put a stop to it.

In its widest fields, the co-operative movement of trade associations to develop and protect the mutual interests of members has had a stony road to travel in the United States during recent years, but apparently a change has come over public sentiment and the pendulum is swinging now in the other direction, which recognizes that such co-operation is valuable, if it is confined within its legitimate channels. We mention the case of the United States so as to introduce a remarkable evidence of this change of public sentiment which is illustrated by the opinion expressed by Edward N. Hurley, vice-president of the Federal Trade Commission of the United States, which has been looking pretty thoroughly into trade conditions. In the strongest possible language Mr. Hurley commended trade organizations as being of great benefit, not only to the industries represented, but also to the people as a whole. "Conservatism," he says, "is the hand maiden of prosperity so far as our foreign trade is concerned. The owners of our vast natural resources are the trustees of the people. When they sell their products at ridiculously low prices—the lumber, the copper and the coal that come from Nature's store-house—they are violating their trust, for ruinous trade spells a waste that brings nothing in exchange." Although these remarks were inspired by a consideration of the foreign trade situation, they apply with equal force to domestic trade and the lesson they teach is exactly the lesson we have been trying to teach in our previous remarks, namely, that the best way to build up trade of any kind is to treat your customer honorably and not to pass him over when you see a chance of putting through a deal with his customer.

The statement made by Mr. Hurley is worthy of being prominently displayed in every merchant's office to act as a guide in the daily affairs of trade. We commend the statement particularly to those who sometimes have a feeling that they must pass over the retail lumber merchant and sell to the consumer direct. It is a poor rule that will not work both ways, and so far as we can learn, the party who initiates a selfish course of trade invariably suffers more than the one who is its innocent victim.

The amount of timber scaled as reported at the office of the B. C. timber inspector, Vancouver, B. C., during the month of May, exceeded all previous records. The exact quantity is not yet known, but will be at least 90,000,000 feet. All the logging camps of B. C. are now working at full speed and further records are expected this summer. According to present indications the demand will continue strong and loggers will give the mills all they can handle. The provincial forest revenue for the month of May amounted to $189,000, which is larger than for the same month of last year and 1914. Noticeable items were those indicating a large number of reinstatements of timber licenses previously allowed to go in arrears.

A Hint for Exporters of Canadian Timber

Our Colonial Timber Trade.—Our enterprising Colonial contemporary, The Canada Lumberman and Woodworker, has issued a very fine Annual Number, dated May 15th, which affords the reader an impressive idea of the magnitude and many-sided interests of the timber trade of the Dominion, as it includes the far-flung forest districts of Eastern Canada, the Maritime Provinces, and British Columbia. The articles in this issue deal with a remarkably wide range of subjects, all of which are of practical interest to the industry. We were pleased to peruse an ably written paper on "The European War and After: the position of the Lumber Trade Before, During, and Subsequent to the Great Conflict," by the well-known Quebec shipper, Mr. Edward Harper Wade. with whom many of our readers are personally acquainted. **Not the least interesting feature in this bulky issue are the 120 pages of business announcements, from which buyers of Canadian timber can glean much useful information.**—The Timber Trades Journal, London, Eng.

Hardwood Rules Remain Unchanged

Proposed Alterations Turned Down at Annual Convention —John M. Woods of Boston the New President

At the annual meeting of the National Hardwood Lumber Association, which was held in Chicago on June 15th and 16th, the most important subject under discussion was the report of the Inspection Rules Committee in regard to a number of additions and changes to the inspection rules. This matter had been under consideration for some time and the Inspection Rules Committee had finally prepared an exhaustive report, which we outlined in our issue of June 1st, the chief points of which were that a grade of selects should be taken out of the upper end of No. 1 common; that the grade of No. 1 common should be divided into "No. 1 common A" and "No. 1 common B"; and that the grade of No. 2 common should be divided into "No. 2 common A" and "No. 2 common B."

While the Inspection Rules Committee presented these proposed changes, its members were not unanimous in supporting them, and when the report was presented to the Association for discussion and action it developed that there was a minority report also to be presented, and that the members of the Association had already ranged themselves into two distinct camps, favoring respectively the majority and the minority report. One of the members of the Inspection Rules Committee, Mr. A. E. Clark, of Edward Clark & Son, Toronto, was an active supporter of the minority report and spoke forcibly in its favor. The chief point made in the minority report was a recommendation "that there shall be no change made in the rules."

The discussion upon the proposed changes occupied the greater part of the time of the annual meeting. Many committee meetings for discussing the matter were held on Thursday, and when it came before the general meeting on Friday there followed a debate which took practically the whole of the day. Finally the majority report was put to the vote. The interest was so keen that every member was polled after his credentials had been carefully examined, and the final tally was strongly opposed to the majority report and its proposed changes, the vote being 213 against and 141 for the changes. It would have required a two-thirds majority of the members voting to carry such a change, so that when it was supported only by an actual minority, the defeat was very definite.

The minority report was then presented, and its chief point, that there should be no changes, was carried after further debate. This means that the old rules will continue in force without any alterations. One or two additions, however, which were proposed by the minority report were agreed upon, making grades for Philippine mahogany and for plain sawed red gum (figured wood) and quarter sawed red gum (figured wood).

There was also a discussion in regard to the grading of cypress. The Association has formerly adopted the grading rules of the Southern Cypress Association. The 1914 rules of this Association were changed, however, and the National Hardwood Lumber Association, not being convinced about the advisability of following the 1916 cypress rules, decided to stick to those of 1914. A resolution to this effect was therefore passed.

In the election of officers a vote was necessary for the office of president, the nominees being John M. Woods, of Boston, and S. B. Anderson, of Memphis, Tenn. The vote resulted in the election of Mr. Woods by 139 to 105, which was subsequently made unanimous. The other officers elected were as follows:—J. V. Stimson, Huntingburg, Ind., first vice-president; F. L. Brown, Chicago, Ill., second vice-president, and C. A. Goodman, Marinette, Wis., third vice-president. The directors elected were as follows:—for three-year term: Geo. Breece, Charlestown, W.Va.; John R. Thistlethwaite, Washinton, La.; J. L. Retting, S. M. Nickey, T. M. Brown, Louisville, Ky.; E. V. Babcock, Pittsburg, Pa.; D. E. Chipps, Fort Worth, Texas; J. B. Wall, Buffalo, N.Y. For two-year term, Chas. F. Mitchell; for one-year term, F. T. Dooley, Memphis, Tenn.

President Wood was conducted to the chair by F. S. Underhill, and after being inducted into office delivered a neat speech in appreciation of the honor conferred on him, following which the meeting adjourned.

Canadian Shingle Exports to the United States

During the month of April 154,389,000 Canadian shingles were exported to the United States, bringing the total of Canadian shingle exports to that country up to 1,448,804,000 pieces for the first ten months of the United States Government's current fiscal year, as compared with 1,164,899,000 shingles for the same months of last year.

The value of the Canadian-made shingles shipped to United States markets for the month of April was $313,812, and the value of those shipped during the past ten months was $2,881,475.

For the calendar year of 1915 the Canadian shingle exports to the United States amounted to 1,775,130,000 pieces, having a valuation of $3,561,907. In 1914 Canada shipped 1,248,726,000 shingles into the United States at an invoiced value of $2,773,009. In 1913, under a 50-cent protective tariff for the first nine months, Canadian exports of shingles to the United States were 346,059,000 shingles; and in the last three months of that year, with the duty off, the total was 215,268,000 shingles, making the total for the year 1913 about 561,363,000 shingles. These had an invoiced valuation of $1,460,571.

During the year 1912, the last complete year in which there was a 50-cent protective duty, the United States Government reports show that 539,434,000 Canadian shingles were imported by the United States.

Increased Rates Proposed to Pacific Coast

The Transportation Department of the Canadian Manufacturers' Association have issued a circular, No. 110, under date of June 24th, calling attention to the fact that the Canadian railway companies gave notice at a meeting held in Toronto a week previous that they intended to make a number of additional changes in rates to the Pacific Coast. The Canadian Manufacturers' Association, in their circular, ask shippers, if they have any objections to the proposed changes to send them in at once, with reasons, as there is to be a meeting on July 6th at Montreal, to go into this question. Among the changes in rates which are included in the new list are the following:—

Commodity	Rates in Cts. per 100 lbs. Present	Proposed
Rail or Track Door, L.C.L	140	165
Peavies and Logging Tools, L.C.L.	190	Cancel
Hose, Metallic, and Metallic Tubing, L.C.L.	178	220
Iron or Steel Bar, Rod, Hoop or Band, L.C.L.	143	Cancel
Bolts, Lag Bolts or Screws, Butts, Nut Locks, Rivets or Screws, L.C.L.	145	Cancel
Castings (finished) Agricultural Implement, School Desk, Waggon, Carriage, Sink Bracket, etc., L.C.L.	175	Cancel
Castings, N.O.S., Sprocket Wheels, etc., L.C.L.	175	Cancel
Chain, N.O.S., including Link Belting, L.C.L.	143	Cancel
Paints and Varnish, L.C.L.	145	Cancel
Book Paper, News, Poster, Cover, etc., L.C.L.	165	Cancel
Wrapping Paper, L.C.L.	165	Cancel
Saws, N.O.S. and Hand Saws, L.C.L.	193	218
Sledges, Wedges and Mauls, L.C.L.	165	Cancel
Twine and Cordage, L.C.L.	175	Cancel

Separate Cheques on Certificates

Toronto Lumbermen Ask Architects to Insert Important Clause in Agreement with Contractors

A meeting of the Lumbermen's Section of the Toronto Board of Trade was held on June 23rd, at which the chief subject under discussion was a proposal to ask the architects of Toronto to insert a clause in their agreement with contractors, which will provide for a separate cheque being issued by the proprietor of a building under construction, payable to the lumber merchant as each progress certificate is due. This subject was brought before the Lumbermen's Section recently by Mr. A. R. Denison, a prominent Toronto architect, who expressed the belief that if the lumbermen would make a request of this nature, the architects would be likely to comply with it and have it put into effect.

The matter was fully discussed by a representative meeting of the Section, with the result that the following resolution, moved by Mr. A. E. Eckhardt and seconded by Mr. T. H. Hancock, was carried:

"That as architects and owners are deeply interested in the supplies furnished by lumbermen for building, and in order to avoid liens and other troubles, the Lumbermen's Section of the Toronto Board of Trade hereby submit, for the due consideration of the architects of Toronto, recommendations which we would like to have them insert in their contracts, as follows:—

"(1) That a clause be inserted in the contract made between the architect and the contractor, requiring the contractor to submit to the architect a summary of the material furnished by the lumber merchant to be used in the building.

"(2) That statements shall be rendered by the lumberman to the architect from time to time during the continuance of the work, showing what material has been furnished.

(3) That the proprietor shall be required to draw a separate cheque in favor of the lumber merchant as each certificate is due.

"(4) That the lumber merchant shall be subject to the drawback clause in the contract."

This resolution has been forwarded to the architects of the city through Mr. Denison, with the request that they endeavor to have the suggestion put into effect.

From the Canada Lumberman of Thirty-Five Years Ago

The Gatineau: We continue the description of the mills on the Gatineau River. The principal are the Gatineau Mills, belonging to Messrs. Gilmour & Company, situated at the village of Chelsea, about eight miles from the city of Ottawa and nine miles from the junction of the Gatineau with the Ottawa River. The scenery above and below the mills is exceedingly romantic and beautiful—four or five rapids and cascades, and sloping banks to the water's edge, covered with trees and foliage, render this portion of the river most picturesque and charming. The mills are situated on the south bank of the Gatineau, above the high falls, and are surrounded by a series of booms and works of great magnitude upon which immense sums have been expended. The whole of the saw logs which descend the Gatineau are caught in these booms, and a very faint idea can be conveyed to a stranger of the immense amount of skill required to separate those belonging to the Gatineau mills from those belonging to different manufacturers below.

During the summer this point of the river presents a scene of bustle and animation of the most extraordinary kind, and as the firm employs literally an army of workmen, the scene can better be imagined than described.

Below the booms, the worst point of the river has to be encountered by the logs descending the stream, and it is frequently enlivened by the appearance of perfect islands of stranded timber, technically called jams, and the efforts of the owners to set them afloat exhibit scenes of daring and endurance seldom witnessed elsewhere.

The mills were commenced about forty years ago. They now consist of two large, substantial buildings, and a smaller mill for preparing lumber for the United States market. The water power used is equal to about five hundred horse power. There are 13 saw gates containing about 220 saws; and twenty edging, buttoning, and re-sawing circular saws. These mills will manufacture 230,000 feet, board measure, in eleven hours, or about 35 million feet per season. About two-thirds of this lumber is cut for the Quebec market, and the balance for the United States. Attached to the mills there are about three miles of wooden canal for conveying the sawn lumber to the piling grounds. Messrs. Gilmour & Company possess timber limits to the extent of 1,700 square miles, whence they obtain the requisite number of saw-logs to supply these extensive works, and 1,000 men receive employment from them during winter and 500 in summer, including lumbermen, farmers, surveyors, etc. They also employ 250 spans of horses; and during each season they consume 40,000 bushels of oats, 600 tons of hay, 1,500 barrels of pork, and 3,000 barrels of flour, besides large quantities of clothing, boots, shoes, etc., tobacco, blankets, etc. These mills are amongst the most celebrated in the country, not only for the romantic beauty of the surrounding scenery, but for the perfection of the machinery employed and the order and good management exhibited throughout them.

On their limits this firm has nine farms, comprising in all about 1,500 acres. The whole of the produce of these farms is consumed by the employees of the firm. On the banks of the River Gatineau they have four principal depots from which supplies are sent to lumbermen at work in the woods. One of these is distant upwards of 200 miles from Ottawa. This firm pays from $275,000 to $300,000 in wages annually.

O. P. M. Goss comes to Canada

O. P. M. Goss, consulting engineer of the West Coast Lumbermen's Association and the Association of Creosoting Companies of the Pacific Coast, is temporarily working in British Columbia, in conjunction with the Forestry Department of British Columbia and the Dominion of Canada, in acquainting city engineers in Western Canada with the possibilities of creosoted Douglas fir for street paving and other municipal purposes. Mr. Goss may work as far east as Winnipeg, and the length of his services in Canada is indefinite. Mr. Goss' work in the United States has attracted the favorable attention of lumbermen in British Columbia, so much so that they made a successful effort to obtain his services for a time at least. The Government of British Columbia is making every possible effort to aid the lumber industry in market extension work. Wood block street paving is not only the most nearly perfect of all pavings in point of durability, dustlessness, sanitation, and low tractive resistance, but each square yard of such paving means a demand for sixty board feet of lumber. Canadian cities are especially adapted to wood block paving.

Major Frank Carew, Lindsay, Ont.

Major Frank Carew, Lindsay, Ont.

The accompanying portrait of Major Frank Carew, Lindsay, Ont., will be recognized by a great many of the lumbermen of Ontario, to whom Major Carew is well known as secretary-treasurer of the John Carew Lumber Co., Ltd., manufacturers of lumber, with mills at Lindsay and extensive timber limits.

Major Frank Carew, who is a son of John Carew, M.P.P. for Lindsay, joined the 80th Battalion, C. E. F., in September, 1915. With this battalion he filled the position of Paymaster with the rank of Captain. Subsequently he was transferred to the 109th Battalion, C. E. F., in which he also occupied the position of Paymaster. He was promoted a little later on to the rank of Major and is at present in camp at Barrifield, Ont.

Major Frank Carew is a splendid example of the best type of Canadian citizen, being a successful business man, splendidly set up physically and keen to assume his obligations both as a business man and a patriotic Canadian. His promotion to the rank of Major, when still a very young man, comparatively speaking, is a recognition of the thoroughness with which he applies himself to everything he undertakes. He is one of the youngest majors in the Canadian forces.

As secretary-treasurer of the John Carew Lumber Co., Ltd., Major Carew has had considerable experience in the lumber business and especially in the handling of employees, a fact which has fitted him in special manner for his duties as an officer in the Canadian forces.

Canada's Wood Exports Increasing

Canada's exports of forest products during the twelve months ending March were as follows:—1916, $51,271,400; 1915, $42,650,683; 1914, $42,792,137; 1913, $43,155,060.

Exports of wood and manufactures of wood during the twelve months ending March were as follows:—

	1915	Total	1916 To United Kingdom	To United States
Logs	$1,258,933	$1,078,999	$ 47,454	$1,031,205
Lumber—Deals, pine	1,148,738	1,249,595	1,170,784	48,441
Spruce and other	6,393,420	9,677,355	8,826,107	263,483
Laths, palings and pickets	1,912,341	2,485,345	11,268	2,460,474
Planks and boards	18,921,445	23,880,341	2,188,164	20,132,928
Shingles	2,987,764	3,644,159	.....	3,619,409
Timber, square	532,955	478,409	463,019	15,390
Wood blocks for pulp	6,817,311	5,743,847	.....	5,743,847
Wood-pulp	9,266,161	10,376,548	336,041	9,372,769
Total	$52,669,591	$62,700,840	$15,134,358	$44,128,021

The imports of wood and manufactures of wood into Canada for the twelve months ending March, 1916, were valued at $8,652,172. During the twelve months ending March, 1915, the value of imports under this heading was $14,505,163. The imports for the twelve months ending March, 1916, were nearly all from the United States, the total from that country being $8,214,991.

An Inspiration to Readers

Editor Canada Lumberman:— Vancouver, B. C.

The splendid arrangement of your extraordinary Annual Number, in which you have compiled information from all parts of the Dominion, and from other countries, thus giving your readers in concrete shape much material of rare value, gives it a just claim upon them for recognition.

While the wonderful amount of thought and energy required to produce such a creditable collection of information, and the task of securing and arranging such a splendid display of advertising are best known to yourself, yet your readers cannot fail to appreciate the value of such an effort in their behalf, even to the extent of a strong feeling of pride and satisfaction at being represented by so live and enterprising a journal. Even though the true value of such work is often under-estimated by busy readers, yet the salient features of this special issue will be an inspiration to its readers.

Yours truly,

E. H. Newton.

Retailers' Reports on Trade Situation

Improvement Noticeable in Several Localities—Quiet Continuing Elsewhere—Below Normal in all Quarters

Hamilton Trade About Steady

Editor Canada Lumberman:— Hamilton, Ont., June 15.

The demand for building material in Hamilton is not very brisk, and while there is a shortage of popular priced houses for renting purposes, nobody seems anxious to supply the demand. There is considerable building of a speculative nature in the east end, caused probably by the demand for homes for men who are employed in the east end munition plants, where a large number of men have been making good wages for over a year.

Comparing the present season with that of a year ago, it appears to us that the demand is about the same. For two or three years before the war broke out business was good. Prices were good also, and steady. Last summer and fall the volume of business declined and prices were cut. During the spring of this year there was some improvement.

The labor market has been the chief disturbing factor. Men were hard to get and the wages asked have been higher than seem to be warranted by the conditions governing our business. Many men have left positions which they have filled for years in large shops and plants at good wages, in order to take positions in munition plants, where fancy wages are being paid which ordinary business conditions will not warrant.

The financial condition of the farmers in this district is good, but large purchases have not been made by them this season, partly perhaps because of the crop outlook, which is not at all favorable, on account of the wet weather.

The demand for lumber for manufacturing purposes has been steady. Some manufacturers are still increasing the size of their plants, although not to such an extent as in previous years.

Yours truly,
D. Aitchison & Company.

* * *

Farm Trade Reduced by Bad Weather

Editor Canada Lumberman:— Paris Station, Ont., June 15.

Trade conditions in most lines, and especially in all building materials and builders' supplies, do not compare favorably with those of a year ago. The building trade is very light, particularly in regard to new buildings in the towns. We were hoping for a fair trade with the farmers, but weather conditions have put a damper upon prospective trade of this kind. The outlook was very favorable at the close of last season, and even up to the beginning of the spring of 1916, as the farmers had had good crops and had realized good prices on almost all their lines. Weather conditions, however, have been extremely unfavorable since the beginning of spring. The continuous rain has held back seeding and germination, especially on the heavier land, and farmers are not showing the inclination to purchase that we were expecting before the commencement of spring.

Those farmers who own their farms are in first class financial condition, but it may be a serious matter for beginners who are working rented farms. Farmers who have live stock for sale are realizing high prices and are generally in good financial shape.

Yours truly,
Geo. E. Taylor.

* * *

Everything Depending on the Farmer

Editor Canada Lumberman:— Brunner, Ont., June 15.

Business with us was about on its usual basis until the middle of April, or a little later, when the farmers commenced seeding. Since then it has not been so good. On account of the great amount of wet weather, the farmers are not yet through with their seeding. This is a flat country, with heavy land, taking a long time to dry out, and therefore seeding has been greatly delayed. A number of farmers have dropped their building operations for the season, and the lumber trade, therefore, will not be so brisk as it was last year. Otherwise the farmers are doing well, as they are getting good prices for their products.

As near as we can judge, business will only be about half as large in volume as it was last year, in the lumber line, unless the weather improves very soon. No corn, roots or potatoes have yet been planted, and not all the small grain. The grass is doing well and fall wheat is fair. Everything in our district depends upon the prosperity of the farmers.

Yours truly,
C. G. Erb.

* * *

Decided Improvement at Hamilton

Editor Canada Lumberman:— Hamilton, Ont., June 16.

At present, conditions show a decided improvement over last fall, but the demand is not for standard lines. House building, with the exception of some of the better class, is very quiet, but additions and alterations to factories are a prominent feature.

The labor situation is in a very unsatisfactory condition and both skilled and unskilled help are scarce, and in the majority of cases very unsatisfactory. If the demand returns to normal it would tax the mills and lumber yards to meet it.

Strange to say, idle houses are few and far between, a condition that was not anticipated owing to the heavy toll enlistments have made in the population.

Yours truly,
The Patterson-Tilley Company.

* * *

Promising Outlook at Stouffville

Editor Canada Lumberman:— Stouffville, Ont., June 15.

Our trade has been very good since March, but there was nothing going on during the winter. Although wholesale prices are somewhat higher than they were a year ago, we are making a better profit out of our sales now than we were at that time. The farmers around here have about 75 per cent. of their seeding done, and the outlook is for a fine season's business. On account of the farmers receiving a high price for practically everything they sell, ready money is rather easier to get than it was a couple of years ago. The farmers around here have been keeping what they made during the last two years or more, instead of plunging into western real estate, which had become quite popular around here. Our trade usually is about 75 per cent. country trade, but during the last season it was practically half and half.

Yours truly,
D. M. Heise.

* * *

Quiet Trade at St. Thomas

Editor Canada Lumberman:— St. Thomas, Ont., June 22.

January, February and March were very quiet in the lumber trade here, much more so than last year, and about 50 per cent. less than normal. April, May and June will be about the same as last year, but not nearly normal. The 1915 and 1916 business will be about 40 per cent. less than 1913 and 1914.

Lumber has advanced somewhat in price this year, especially hemlock and spruce. White pine is at about the same price as for the last three years. All hardware has advanced materially, especially screws and nails. Glass has taken a jump of about 35 per cent.

The labor situation would be very serious if business were normal, and at the present time it is almost impossible to get a man. There is not a man idle who wants to work.

Yours truly,
The Green Lumber Company, Limited.

* * *

Sixty or Seventy Per Cent. Normal

Editor Canada Lumberman:— Burlington, Ont., June 15.

Our retail lumber trade at the present time consists chiefly of business received from farmers and fruit growers, with a fair percentage of suburban home building. This class of trade is about normal and equal to other years, but there is practically no speculative building going on here.

Prices and collections are very good, as would naturally be expected with this class of business. Generally speaking, we do not believe that our retail business is more than sixty or seventy per cent. of normal, and it is principally made up of small cash business.

Yours very truly,
Nicholson Lumber Company, Limited.

* * *

Brantford Trade Active

Editor Canada Lumberman:— Brantford, Ont., June 15.

We are pleased to advise you that while the local building trade is seriously affected by the war, there are, nevertheless, a large number of contracts for factories and important improvements being let. The large number of war contracts that many firms have secured and the shortage of laborers, owing to the heavy recruiting in this locality, have made it possible for practically any person to secure a position. The trade, compared with that of a year ago, is much better; in fact we find it difficult to secure enough men to enable us to fill the various orders we have received. The local demand from manufacturers who have secured war contracts is benefiting us considerably.

Yours truly,
The Schultz Bros. Company.

* * *

Quiet Trade at Berlin

Editor Canada Lumberman:— Berlin, Ont., June 19.

The trade in our immediate district is not very brisk, in fact it is poor compared with conditions before the war.

The town trade is very slack, but the farmers seem to be doing consider-

ably more building and repairing than in other years, which makes it appear that the farmers are in better standing financially. The furniture trade in this district has apparently picked up considerably, but in our line it is very slack.

Yours respectfully,
H. J. Hall & Son.

* * *

Conflicting Conditions at Brantford

Editor Canada Lumberman:— Brantford, Ont., June 17.

Our business is now largely connected with the steel trade and not with the lumber interests. Incidental to our other business we manufacture wood tanks. Our output for this year is practically sold.

Many conflicting conditions exist on account of the very high price of steel products and the scarcity of labor, and it is next to impossible to sell the products we produce at a comparative advance in price to meet the conditions of excessive cost of both labor and material at this time.

Yours truly,
Goold, Shapley & Muir Company, Ltd.

* * *

Marked Improvement But Still Below Normal

Editor Canada Lumberman:— Hamilton, Ont., June 14.

We find a marked improvement in business compared with that of a year ago, but the volume is still much below normal.

Yours truly,
Wise Lumber Company.

In the Public Eye

A budget of comment presented in the interest of public welfare, independent of party politics and with malice toward no one.

The Ross Rifle Again

Startling indeed in view of the attitude adopted by the official and unofficial apologists of the Ross rifle is the news contained in the London letter to the Toronto Telegram. Briefly, the correspondence is to the effect that following complaints from all branches of the service, Gen. Alderson, in command of the Canadians, formally protested to the Canadian Government against arming the men with the Ross rifle, which has proved, according to the soldiers, a failure and a pathetic failure at Ypres and was later to be followed by a similar failure at St. Eloi.

General Alderson's protest was received and answered in a style that unfortunately for the good name of the Dominion is becoming to be regarded as characteristic of the administration of the militia department. He was told to mind his own business and the Canadian soldiers were told to take what the militia department considered good for them and were warned that any further objections to the use of the Ross rifle would not be tolerated. The printed circular containing this warning was apparently an artfully contrived defence of the rifle and an obvious attempt was made therein to blame the faults of the arm on the quality of the ammunition used by the troops.

The main point and the point that will appeal to most people who have little or no knowledge of what constitutes a good military rifle or makes a bad one, is that the men who are using the weapons should be the best judges of its fitness for the work they have to do. When a man's life depends upon the quality of the weapon which is his sole individual defence, he is apt to be curious about it, he is likely to watch its effect and eager to learn all about its dependability, or otherwise, in a crisis. In the case of the Ross rifle there seems to be little doubt that it was unsuitable in the opinion of the vast majority of the men armed with it. That in itself should have been sufficient to cause an investigation of the most careful and painstaking kind. Instead, we are compelled to hear that the protests of the men expressed through their officers and divisional commanders, were received with disdain, and that eventually the Canadians were collectively reprimanded for their attitude and warned that no further nonsense would be tolerated. This to men who were willing and ready to face death for the Empire, and who, it seems to us, should have been given every consideration and whose opinions should have been respectfully listened to and met, if possible. Putting aside all consideration of the technical faults or merits of the rifle, it would seem that it would have been a wise policy to have made a more tactful reply and to have demonstrated to the troops that they were not being sacrificed for political reasons or for any other reason. If the morale of the troops depended on a change of rifle, it should certainly have been effected, and at once. This aspect of the matter would seem to be the common sense view of the dispute.—Ottawa Citizen (Independent Conservative.)

Market for Doors in India

A report upon the market for doors in India has been received by the Department of Trade and Commerce, Ottawa, from Mr. H. R. MacMillan, Special Trade Commissioner, and published in the Weekly Bulletin. The report says:—

Nearly all doors in India are solid teak. The usual pattern is a double opening French door, each section of the door with three solid panels flush on one side, raised on the other, the double door being 3 feet 6 inches by 6 feet 6 inches. The retail prices at which these doors sell in Calcutta are:—

Thickness Frame	Panels	Price per Square Foot
1 in.	½ in.	32 cents
1½ in.	¾ in.	38 cents
1¾ in.	1 in.	44 cents

The accompanying illustrations show the type of door, both full panels and half panel half glass. Imported doors have not been used for the reason that it has been believed that no imported wood would withstand the climate or the white ants. Sample solid panel Douglas fir doors which have been in use in Delhi three years have not been touched by white ants and have in no way been affected by the climate, though the fluctuations in Delhi range from a very dry shade temperature of 112 degs. F. in the hot weather to a temperature of 95 degs. F. in the rains with an accompanying humidity of over 90 per cent., conditions as severe as any wood is likely to meet in use.

Doors are not commonly carried in stock in India except by

large hardware, machinery and general furnishing companies in three or four of the principal cities. The market, which is limited to government and other public buildings and the requirements of the comparatively small European and wealthy native community, is supplied with doors made to special order. Douglas fir doors are equal to the teak doors in appearance and superior in manufacture to the ordinary Indian-made door; they can be put on the Indian market, if shipped with lumber cargoes, much below the price for teak doors. The market, while small, should amount of several thousand doors yearly. Canadian exporters when making shipments of lumber should arrange with their representatives in India to introduce fir doors. The names of the three most important dealers in doors may be obtained from the Canadian Intelligence Branch of the Department of Trade and Commerce.

Mr. W. P. Kearney, manager of the Dominion Chain Company, Montreal, has been on a business visit to Newfoundland and the Martime Provinces.

Can Any Lumberman Furnish this Information?

Editor Canada Lumberman:— Moyertown, Alta.

I am informed that there is in use in some of the lumber and supply camps in the east, a single rail track built on ties without the roadbed being graded. The cars in use run on two wheels tandem and the power used is one horse, which travels beside the car and is hitched to an arrangement similar to a pack-saddle, thus helping to balance the load on the car. Can you give me any information regarding this, with cost of the equipment, cost of installation and maintenance? We are farming twenty miles from the railroad and one of the big difficulties is the transportation problem.

Yours truly,
E. H. Benner, Jr.

Advertising—An Aid to Retail Dealers

The Merchant's Duty to His Community Involves Active Business Campaigning—The Uplift of Good Advertising

By J. B. Powell

Two years ago an article entitled "How Advertising Affected the Construction of My Bungalow," appeared in one of the leading magazines of the business press. The article started out in this way:

"About five months ago I employed an architect to prepare plans for a residence for myself and wife. Today the house is completed and ready for occupancy.

"About four days after I gave the architect his commission I received a bulky package of literature on heating systems. Since that time I have received in all exactly one hundred and fifteen pieces of literature pertaining to house building.

"I am open minded to all forms of advertising, likewise my wife, so we both determined to see exactly to what extent advertising entered into the construction of our home. Yes, we had just been married, so it had to be a bungalow, of course.

"Therefore, the ads of bungalows stuck out from the magazine pages like doorknobs, but this is too early on doorknobs, for that comes a little later in the story."

The article told all about the selection of hardware, lighting fixtures, and so on, and then it came to the subject of lumber.

"Now about lumber, and in this connection I had almost forgotten something. Before our contract was let we were solicited by various retail lumber firms who wanted to look over our plans. Here we were initiated into some of the secrets of the trade! One lumber company said, 'Don't let that contractor Smith have the job, for he owns an interest in the Jones lumber yard, and everybody knows how punk they are,' and so on down the line. Before we let our contract we inquired into the contractor's lumber-yard affiliations and found he had none, so we obtained our lumber from a thoroughly reliable company. And thanks to our architect we got some of that 'Cypress, the Wood Eternal,' that we had seen advertised so much in our magazines and newspapers, and that we desired so much. And we got an excellent line of pine and oak for inside finishing and trimming. It's a pity such fine material should be nameless."

The writer of this article is quite well acquainted with the person quoted above, so it also should be stated here that the bungalow referred to was constructed of hollow tile and stucco. The Cypress for exposed places and the pine and oak for interior finishing was all the lumber that went into this house—thanks to the advertising of the manufacturers of other kinds of building material—lumber substitutes.

A few years ago we used to read articles telling about the rapidity with which our forests were being consumed and that the time was not far distant when there would be no more lumber. Now, if something is not done to increase the consumption of lumber, we may be reading articles wondering what we will do with our great unused forests. The only thing that will sell lumber, as well as shoes, or breakfast food, is advertising—and certainly the retailer has an interest in this subject. I will not vouch for the accuracy of the statement, but an officer of the National Lumber Manufacturers' Association told me recently that the manufacturers of safety pins spend more money annually in advertising than the entire lumber industry. To use his words and make a poor joke at the same time, he said that "Lumber advertising is below the creeping stage."

In a speech before one of the meetings of the Associated Advertising Clubs of the World, a member of the firm of one of the large department stores recently said that a store that did not advertise at all, or a store that did not advertise properly was simply lacking in its plain duty to its public. An officer of the Agricultural Implement Dealers' Association of Missouri, who is himself a successful small town dealer, recently made the same statement. He said:

"The merchant who by reason of inferior service in salesmanship; insufficient advertising; or poor business methods is not equipped to fulfil to the utmost his proper place in the community, to that extent is, himself, a factor in the community's downfall. The merchant's duty to increase his sales, or his business, should not come from robbing his weaker brother in business, but should come from an effort along with him to make the community in which he lives more productive and thereby to raise the purchasing power of that community."

If advertising is a definite part of the service that a store should render, certainly the lumber dealer occupies an excellent position for the greatest service. The progress of man can be marked in the character of his dwelling and its appointments. The word "home" has always had a sacred meaning. Statistics compiled in large cities show that most immorality and unhappiness result from congested conditions that make "homes" impossible. The census shows an alarming tendency for people to congregate in the cities, the most promising young men and women of the rural sections going to the cities. Investigation showed that one of the main causes for the exodus was poor living conditions on farms. Now there isn't a college of agriculture that does not have its classes in Rural Economics, Rural Sociology, and other courses all aimed to correct conditions in rural sections.

This has an interest for the lumber dealer, for he can make himself a potent force for better conditions in rural communities. And better conditions in rural communities mean modern homes, barns and silos, and better roads.

Advertising can be made one of the greatest forces in this campaign for community betterment. Advertising has been called one

ONE OUT OF THREE DIES

CAN YOUR BUSINESS STAND THIS LOSS?

Mr. Farmer, your hog market day has two drawbacks. It doesn't come often enough, and it doesn't bring you enough when it does come.

You can change this condition.

Will You Do It?

The most successful hog raisers in Bates county tell us that if a sow is not properly housed at farrowing time she will lose on an average of one pig out of every three that is born.

One farmer told us that he had 6 pigs out of a litter of 8 chilled to death for lack of proper shelter on his farm last week. He said in 4 months these 6 pigs that died could have been sold for enough to have built FOUR individual hog houses for four sows.

The manufacturer that makes the implements you farm with must have a house to make them in. Likewise, if you make a success manufacturing pork you must have a house to save your pigs in.

An individual Hog House, 6 feet square, made of good, tight Ship-Lap, will only cost you $3.75, the price of one pig, and it will be the means of saving three or four out of every litter.

Don't wait like the farmer did last week, and lose SIX nice healthy pigs, but build you a HOG HOUSE this week, and make a profit on every sow you own.

ARE YOU GOING TO LOSE?
INVEST $3.75 AND WIN

Logan-Moore Lumber Co.

Phone 18 Butler, Missouri.

This advertisement measures two newspaper columns by eight inches in depth. It was inserted in a local weekly newspaper by a lumber dealer three times with the wording changed each time. A circular containing much the same information was also mailed out to farmers. The ad. and the circular brought in $40.5 in new business. The hog-houses advertised had been built of rough lumber by carpenters in the dull season.

LUMBER IS THE BIGGEST THING
We Handle and Think About

It is therefore natural that we should have more knowledge of the use and protection of lumber than those who see very little of it.

A can of our pure paint mixed ready for use and one of our brushes, which have the bristles set in rubber, will do more to protect and beautify the woodwork on your house and about the premises than many times the same amount of money spent in any other way.

Tell us just what you want to paint or varnish and let us select the kinds that will do you the most good for the least spent.

NORTHWEST ARKANSAS LUMBER CO.
Phone 9 On Dickson Street

Flies are disease carriers.
Live and breed in all kinds of filth.
Infect food and drink by germs laden feet.
Each female fly can lay 150 eggs.
Screens should be used to keep them out.

THE HEALTH OF YOUR FAMILY
Is the Most Important Thing in the World to You

Fly and mosquito screens are a necessity. There is no further question as to whether or not these pesky little insects carry disease.

The right kind of screens can be made to beautify your home as well as protect the health of your family.

Whether it be a front door, a window or a sleeping porch, we have the goods right here to screen it.

Shall we send a man up to measure your work and give you an estimate? The work can all be finished to match your other woodwork.

Phone 9 **Northwest Arkansas Lumber Co.** On Dickson Street

These advertisements show how it is possible to attract attention to the individual advertisements by the use of simple pictures, plain type faces and simple borders. Manufacturers are always willing to supply the necessary electros.

of the greatest modern forces in the evolution of the race, for it makes persons want better things, and in order to obtain the better things, persons must work harder to obtain them. And therein lies advancement!

In connection with this article are shown two classes of advertisements; one illustrates advertising copy that the merchant can use to advantage in his "community betterment" work. The other advertisements are simple merchandising advertisements that show how it is possible to obtain best results from simple electroplate cuts that the manufacturers supply. One thing to bear in mind in advertising is, that before an ad is read it must attract attention. To attract the right kind of attention is to sell goods—or better yet—to sell lumber.

Improper Piling of Lumber Causes Great Waste

A valuable report upon the proper piling of lumber has been issued by the United States Government, which shows that improper piling of lumber both at the mills and in the retail yards results in needless waste of large quantities of valuable material that might be saved, and that lumber manufacturers and retailers could, by a very little exertion, not only eliminate the causes that lead to decay, and therefore save lumber, but furnish material in brighter and better condition than they sometimes do, is the gist of a report on the question of handling lumber just issued by the government. This report follows:

One of the most important problems confronting the lumberman is the storage and marketing of his product in as sanitary a manner as possible, both to prevent direct loss to himself through deterioration of his wares, and to protect the consumer against many avoidable outbreaks of rot after the timber is incorporated into buildings.

The investigations of this department during the past two years have revealed many deplorable conditions in the storage of timber and, coincident with these, have disclosed many serious outbreaks of rot in important structures. While many of these cases of rot in buildings may be due to faulty construction, particularly in insufficient seasoning of the timber before use and to the failure to provide for sufficient ventilation in basements, the fact remains that infected timbers placed in buildings are far more likely to cause trouble than sound ones.

Decay is due to the growth of wood-destroying fungi through the timber. These fungi consist of fine cotton-like threads which penetrate the wood cells and by the secretion of ferments dissolve many of the constituents of the wood. For their most active growth the timber must be moist and the temperature favorable. The true dry rot fungus (Merulius lachrymans), the most destructive fungus in buildings, grows best at seventy-two to seventy-five degrees Fahrenheit, but there are many others which thrive best at seventy-eight to eighty degrees.

Poor ventilation favors rot by not allowing the timber to come to an air-dry condition quickly enough to prevent the development of the fungi.

The spread of wood-destroying fungi may occur in two ways:

1. By the continuation of growth from an infected stick to a sound one in contact with it.

2. By the production of spores (bodies comparable in every way to ordinary seeds, but much smaller) which are blown about by air currents and, lodging on moist, sound timber of a kind susceptible to decay, germinate and start a new infection.

Many lumber yards are very lax in keeping the premises free from rotting debris which serves as a breeding ground for serious fungi, and hence a constant source of infection for sound timber. Other dangerous sources of decay are:—

1. The rather common practise, particularly at saw mills in the coastal regions, of piling timber over swampy land, subject to flood or tides, or so constantly wet as to make it very difficult or impossible to keep down the rank growth of weeds and grasses which cut off the air circulation and prevent the proper drying of the lumber.

2. Piling sticks which are thrown promiscuously about, or even piled directly on the ground, and allowed to become infected. Very few yards pay any attention to this important feature of sanitation. The almost universal practice is to throw them on the ground whenever stacks are torn down, leaving them there until needed for new piles.

3. Pile foundations of timber which in the course of a few years become diseased and produce many fungous fruit-bodies which release millions of fresh, vigorous germs in the form of spores. Many foundations do not permit of proper ventilation beneath the piles, a condition which often encourages severe decay in the base of the stacks by the gradual progress of fungi upward from the ground or debris over which the lumber is piled.

4. Improper methods of stacking lumber, which do not provide for sufficiently rapid drying.

5. Poorly constructed storage sheds, particularly with reference to insufficient ventilation beneath. A considerable number of such sheds have been investigated where very widespread and destructive outbreaks of some of the most virulent fungi with which the builder has to contend occurred.

6. Tramways and tracks about the yards which become severely infected with decay and permit the development of an abundance of fungous fruit-bodies and spores. This is of particular importance in the case of elevated tramways from which the spores can be distributed for long distances.

To sum up, then, the sources of decay lie in allowing rotting debris to accumulate, in allowing pile foundations, tramway timbers, track ties and supports under lumber storage sheds to become infected, thus passing the decay on directly to timbers which lie in contact, or indirectly to more distant timbers through the agency of spores.

Since decay is due to the presence of wood-rotting fungi the obvious first principle is to render conditions about the lumber yard unsuitable for the growth of the organisms. This can be accomplished by attention to the following details:

1. Location of Yards—Wherever possible storage yards should be on high and dry land, on mineral soil rather than filled-in debris. This will greatly simplify the weed control problem and insure proper ventilation around the base of the lumber stacks. Occasional wetting and silting of lumber by floods, tides and storm waves will almost invariably cause rot.

In all cases, weeds should be kept under control. This is frequently done by pasturing or mowing. Chemical sprays offer possibilities in this connection also. A concentrated solution of common

salt, (125 pounds per fifty-two-gallon barrel) is effective against a considerable number of weeds if applied to the younger plants twice during the year at the rate of one barrel per acre.

A 2½ per cent. solution of sulphuric acid would be much better, but requires considerable care in handling and must be used in glass containers or other kinds of material which has been enameled or coated with paraffin.

2. Cleaning-up of Yards –The most careful attention should be given to this phase of the question. The writer has seen yards where hundreds of thousands of feet of lumber have rotted in storage and either been left in the original piles, often with new lumber piled on top, or else scattered about the yard or its immediate vicinity until completely decayed. Such material should be thoroughly collected and burned.

3. Greater care in handling piling sticks and stacking lumber.—A piling stick infected with an actively growing wood destroying fungus can spread infection to any part of the pile of green lumber where it may happen to be placed, so the necessity for carefully guarding these strips and keeping them from contact with the ground is obvious. They should preferably be cut from heartwood of very durable timber, such as resinous pine, red gum, white oak or similar woods, and dried before use.

Many lumbermen prefer to use the lumber itself for cross-strips. This ordinarily gives little trouble where the boards are properly spaced and the narrower widths are selected for the cossers. In the larger piles, a central flue one board wide is often of distinct advantage. The edge piling of 2 x 4's as practised at some mills is favorably reported.

Timber should never be allowed to lie, even temporarily, in close piles on the ground or on decayed tramways.

4. Better construction for pile foundations—Very often pile foundations are altogether too low or are poorly constructed, not allowing sufficient ventilation beneath the sticks. The laying of a few planks on the ground parallel to the alleys does not make a good pile support. In the first place, it allows circulation in only one direction, and in the second place such a foundation is usually too low. Being more or less permanent structures and partly in contact with the ground, pile foundations should consist of horizontal timbers set on concrete or brick piers, or blocked up at intervals with wood, to a height of at least eighteen inches from the ground. Such timber as enters into their construction should be either highly durable or else treated with some wood preservative. Coal-tar creosote will serve as an efficient antiseptic.

Sound, air-dry blocking cut from many of the low-grade species of timber having a goodly percentage of sapwood can be given a satisfactory treatment by heating in a tank at about 200 to 220 degrees Fahrenheit for four to six hours, then allowing to cool in the oil. The longer horizontal timbers can be given three coats of hot creosote at 180 degrees Fahrenheit at intervals of twenty-four hours. Heartwood in this case is much to be preferred to sapwood.

These remarks apply to the construction of storage shed foundations as well as pile foundations in the open.

5. Preservation of tramway timbers and ties—The decay of these timbers can be overcome by treatment with creosote or some other good wood preservative. The work can be done by commercial wood preserving companies or by the lumberman himself in the ways above indicated.

6. Dipping stored lumber to prevent infection—Dipping green lumber in soda solution to prevent bluing is at present a recognized practice in the United States, particularly in the Southern pine belt. While soda is more or less effective against bluing it will hardly be of much value in preventing attacks of other fungi. A more toxic substance, such as sodium fluoride, is suggested. This substance can be substituted for the soda dip very readily and would serve the double purpose of blue-stain prevention and also protection against incipient decay.

Timber which shows any trace of decay should never be sold or accepted for building purposes, as open dormant fungi in dry timber can often start into active growth when placed under moist, comparatively warm conditions.

Mr. H. Shumway Lee, of Mixer & Company, Buffalo, N. Y., recently returned from a visit to Nova Scotia, where he completed arrangements for handling stocks of white pine, spruce and hemlock from that province. These stocks are shipped under normal conditions by vessel to Boston, but on account of the scarcity of tonnage it is likely that a rail business will be carried on with New England points and part of New York State.

Mr. J. H. A. Acer, secretary-treasurer of the Laurentide Company, Limited, Montreal, has been appointed captain of the 244th Battalion, now being raised by Lt.-Col. F. M. McRobie.

Handling the Consumer

By H. S. Sackett

The proper handling of lumber consumers in any community means a systematic listing of names, and a follow-up system. The best plan is usually to install a simple card system, giving the names and addresses, and noting on the cards the needs and requirements of the different individuals as ascertained, and the time of their last purchase. For example, if you find that a farmer in your community is contemplating building a new barn next spring, or a new silo, this should be noted, and should be followed up by letters and literature on the subject. A constant stimulation of interest is necessary, either by circular letters, by envelope inserts, or the distribution of literature.

You should have displayed in your offices attractive samples of the woods that you have for sale. You should show them in the rough, and in a surfaced condition; you should show samples of moulding, of casing, of base boards, of interior finish, panels, and all the various products of wood that you have to offer. You should fix them up so neatly and attractively that the man who is going to build a home would come to your office, and look over your commodities in just the same way that he goes to a dry goods store and looks over their goods before he buys.

It would be an excellent plan from time to time for groups of dealers in the larger towns and cities to get together, and have a dinner and invite your architect and engineer friends to come and talk to you about their problems.

Keep in touch with what is going on in your home town. If a change is proposed in the building ordinance, know all about it; find out what the changes are going to be; ascertain if anything detrimental to the use of wood is proposed; white the trade extension department of the N. L. M. A. what is going on, so that we may have an opportunity of sending one of our special representatives to help you, if help is needed.

Take an interest in the question of fire protection; keep in touch with your building commissions and city councils; show them that you are as much interested in safe building construction as any other good citizen, or as the manufacturer of non-combustible materials; make it clear to them that it is not the use of wood, but its unsafe use, that contributes to the fire danger, and here again, if you have any problems which you cannot solve and which you do not feel sure about, ask the National Association for the specific ways in which it can be of service to you.

There has been a great waste in the past and a failure to get the most out of available literature, because of the poor display or lack of distribution. You should have in your office an attractive rack in which the more important lumber literature is displayed. This would make it available to callers, and also serve as a reference library. A good plan is to send out notices from time to time to the consumers, stating the literature which is available in your office, or which will be sent upon request. You should notify your customers from time to time that you have a good reference library on farm structures which is at the service of any who may be interested.

Planing Mill Pleasures vs. Profits

By L. R. Putman

Were you ever afflicted with the malady known as a planing mill? talk about your leprosy and pellagra; why they're mere pastime. Operating for appendicitis is really amusement when compared to operating a planing mill. The oldest man in the world can't operate a planing mill with satisfaction either to himself or his customers. A fellow that runs a planing mill stays just about three jumps ahead of the sheriff and has got to take a hurdle every jump.

In the first place, he didn't have good sense or he wouldn't have gotten into the planing mill business, and then the longer he stays in the less sense he has. A man with a planing mill is afraid to go to bed at night for fear it will burn up and hates to get up in the morning for fear it hasn't.

Did you ever notice that the fellows who sell planing mill machinery never quote by letter. No, sir; if they did they'd never sell anything. The fellows that make and sell that stuff have got some kind of an instinct that informs them at just what moment some poor lumberman's mental capacity reaches an ebb sufficiently low to make him a victim. Then these vultures begin to approach their victim from all directions. One of them will ease up to him quietly and begin telling what so and so did with one of his machines. He spits out figures so fast that he gets the weak-minded lumberman to wobbling. Then the salesman slips him a cheap cigar and that finishes him; he doesn't wake up until he has signed the order and the salesman has gone. Then he begins to try to pacify himself by taking the salesman's side of the argument and going over all the wonderful things the machine will do. If a fellow will just give way to such dissipation he can figure himself out rich in about fifteen or twenty

minutes. Money made in the planing mill business is the prettiest money in the world—on paper.

No, if you write to a woodworking machine company and ask them for the price of one of their machines, you'll find one of their salesmen waiting for you at the office next morning when you go down to open the yard. He's a good natured cuss and he's sticking one of those fatal cigars out at you just as soon as you are close enough for him to know it's you. As soon as you get the office door open he'll begin to carry in his junk and pile it up on the desk in front of you.

He has photographs and steel engravings and wood cuts of every machine known to the human race. He strikes a match across the top of your newly varnished desk and you and he light the Flora-de-la rags and start up a smoke like the wood's afire.

Your last recollection is a string of machines passing in front of you like a moving picture show. Then the next strongest impression made on you is that you have a note coming due at the bank about every fifteen days for the rest of your life.

Of course, if there wasn't anything to buy but the machines a fellow could run his stock down and get along with a mixed car of C and better stuff in the rough and in that way take up the notes as fast as he could collect his outstanding accounts. But he's just getting started well when he gets his machines set up. He has to buy a lot of steel line shaft and pulleys and belt—say, did you ever buy any leather belt? Some of us have bought shoes for five or six children and thought leather was high enough. But you just tackle a leather belt some time. Why, I'll bet I can carry a thousand dollars' worth of two-ply leather belt around the block and never get a long breath. If you stuffed your safe full of good leather belt you'd have more value in it than if you used ten dollar bills. The machinery salesman will forget to tell you these little trifles when he hands you the knock-out cigar and that's the reason I'm telling you now. By the time you are ready to start you have got a mortgage on your real estate, and then you haven't anything to do but work and worry.

A Lesson Told in an Automobile Parable

Maybe some of you fellows have put in some time fooling with an automobile? You can look an automobile in the face today and she will run fine when, maybe, tomorrow she's got the same countenance and won't budge an inch. Well, now, suppose you had a whole flock of automobiles around you, you were ten miles from home and it would cost you a good customer if you didn't get there in the next hour? That's just the shape you're in every minute of your life when you're operating a planing mill. Of course, I don't want to discourage any man who wants to put in a planing mill. It's no use. If you don't let him spend his money that way he's apt to go and buy the Eads' Bridge in St. Louis or the Convention Hall in Kansas City. That kind of a man is dangerous as long as he's got money anyway. One of the brightest remarks I ever heard made along this line was uttered by a farmer who thought he wanted to break into the planing mill business. He let the word leak out and one of those machinery fellows bobbed up with a full line of pictures and bum cigars. Right there's where the farmer got the salesman's goat; the farmer didn't smoke. He made that salesman do all the smoking and talking and he just kept his mind on the price. Finally, after the salesman had done all he could to keep from setting a value on his goods and then when there was nothing else to be said and the farmer got nervous from inhaling the fumes of the cheap cigar, he began to figure up the price of a planing mill. The farmer watched the salesman's pencil and when he saw the total running up above $2,000, he said: "Here, young feller, you needn't go no further; if I had as much money as $2,000, I wouldn't have a durned planing mill."

But, of course, it's a well-known fact that there's a sucker born every minute, and consequently there's a fairly good demand for woodworking machinery around the retail lumber yards.

The Retailer's Planing Mill Equipment

Retail lumbermen have always handled woodwork and always will and they should. I mean the ordinary country retailer. Lots of it looks and is simple to make. The trouble is that stuff that is easy to make is made by everybody in the business and is therefore sold on a close margin. Some dealers imagine because they have handled woodwork for a great many years that they know all about it, and have a good idea what it should cost to make it.

They're a good deal like the fellow who went into a shoe manufacturer's office and asked for a job selling shoes on the road. The sales manager said: "Are you pretty well posted on shoes?" and the would-be salesman said, "I ought to be, I've worn 'em ever since I was twenty-one years old."

Now, two or three machines can often be worked to a good advantage, but I'm talking about a planing mill that can really take care of a job of woodwork. I like the word woodwork. I got it from a big sash and door house and it means more to the average consumer than millwork. You might be operating a good big planing mill and advertising mill work every week in the year, and then one of your oldest friends would come in and ask you if you were fixed to make a door frame ready to set in the building.

Most of the excitement comes when a fellow tries to figure out the price to put on a given piece of woodwork. The oldest man in the world can't figure out the exact cost of an ordinary job of woodwork. You can pay a man as much every year as your plant is worth and he can't take the work off a set of blueprints and specifications and tell you what it will cost to make it. This applies not only to the small country planing mills, but to the large sash and door houses in the large cities. Every retailer knows that if he sends the same plans to a half dozen big woodworking factories for estimates, he'll get a half dozen estimates which will vary from 10 to 40 per cent. He at once reaches the one logical conclusion and that is, that one fellow is letting his stuff go mighty reasonable or the other ought to be put in jail for grand larceny. But, stay, don't judge these poor devils too hastily. The next job you have, send it right back to these same mills and the chances are the high and low man will change places. They wouldn't take a dollar of your money unjustly, and they don't do it. Go and look over their books and they can prove to you that it's the stock stuff they job that makes them rich and not the special stuff they make. If a fellow keeps doing the same thing over and over again every day, the cost of his product can be arrived at fairly close, but if he does something different every day, then the fellow in the office who does the estimating must shut his eyes and grab in the dark. A good friend of mine who is connected with one of the biggest sash and door houses in the country, told me that they had a club in the city where his plant is located, to which only men who do estimating on woodwork are eligible. There are about thirty men in his city who belong. Once every week or two they bring all of the estimates they have made since the last meeting and go over them together. Each fellow tells how he arrived at the cost of the different jobs. They don't do this in order to fix prices and they couldn't, because the jobs have already been sold. But they do it in order to post themselves on how to arrive at costs.

He Forgot to Figure in the Cost of the Lumber

This man told me that at one of these meetings a certain job came up on which most of them had figured. It was an expensive piece of quarter-sawed oak work done in the form of a dome. Every man with any knowledge of woodwork knows that such work runs into money fast. One fellow was about $900 low on his bid, and, of course, all were interested in knowing how he was able to do it so cheaply. Each item was gone over carefully and every fellow watched his own figures for the big difference. In the wind up it was found that the fellow with the low figure had left out the lumber. It isn't a difficult thing to leave out something in figuring what it costs to make woodwork. At the present time it takes about as smart a man to let a job alone as it does to bid it in. One thing that a fellow nearly always manages to get into a job of woodwork is grief, and another thing he just as often leaves out, but which, of course, doesn't usually amount to much—and that is profit.—St. Louis Lumberman.

Forestry Battalion's Work Appreciated

In the British House of Commons recently, Mr. Acland (Parliamentary Secretary to the Board of Agriculture), referring to the work of the Timber Committee of the House, made the following interesting reference to the operations in connection with the conservation of home grown timber, for which the Canadian Forestry Battalion was recently formed and taken to England:—

Perhaps the most important Committee from a national point of view of these three Committees is the Home-Grown Timber Committee. This Committee was set up at the end of November last. Its object was to increase our supplies of home-grown timber, not by supplanting but by supplementing the efforts of the timber trade, particularly as regards the supply of timber for Government Departments—the clear, outstanding object of its work. To the extent to which this work can be successful there are two gains: First, the State obtains timber at a reasonable price, and, secondly, which is even more important, we save in freight, of which normally a very great deal is taken up by timber imports. The work of the Committee has divided itself into three distinct parts; (1) the organization of purchases; (2) the organization of plant; and (3) the organization of labor. In all three directions the task has been not to take hold of any existing valuable machinery, but to make available machinery which would not otherwise have been available for this purpose at all. We have had, in fact, to start from nothing and to build up an organization which, I hope, is now becoming fairly effective. I will simply report results, which are that we have either supplied or purchased, or are in the process of felling and converting, about 11,000,000 cubic feet of soft wood for use as scantlings or sleepers and in dug-outs at the front, and about 32,000,000 lineal feet of pit-prop and wire-entanglement timber. We have also bought less quantities of certain hardwoods. Landowners, on the whole, have been most public-

spirited in offering us their timber at prices which, I think, have been fair to them, but which often have been rather less than they could have obtained elsewhere from timber merchants. It is a pleasure to be able to add that the Crown has set an example with regard to the use of the New Forest and the Windsor plantations such as the Committee would expect in a matter of this importance.

As to labor for timber-felling purposes, we have been in negotiation as to, or have actually employed Belgians, Portuguese, Irish, soldiers, Public-school boys, Maltese, Indians, Canadians, German prisoners, and labor found through the Employment Department of the Board of Trade. Of all these different sources by far the most useful and valuable have been the Canadians. I cannot express to the Committee the energy which was shown by the Government of Canada, as soon as the matter was put before them, and by the officers whom they appointed in raising a Forestry Battalion, which has come over here to work in our woods. The Government and the people of Canada are naturally interested in their own timber, but they realized that the position of the Empire as to freight was so serious that we could not now be expected to supply our needs from Canada if it were possible to supply them here at home. They have shown a true Imperial spirit in helping us to supply them in the most practical manner possible. The only difficulty will be to keep these men with big enough blocks of timber to cut. We, as a Committee, shall do our best, but if any member of the Committee here has a block of, say, 2,000 or 3,000 acres which he would like to see melt away before his eyes under the most expert felling and conversion of our friends from the other side of the Atlantic, I shall be most happy to receive his offer.

The Committee has made an arrangement for the employment of 500 German prisoners. That number will be employed in felling timber under conditions approved both by the War Office and the Admiralty. In connection with this timber work it might interest the Committee to know that we have had to take the power of requisitioning timber. We do not intend to obtain our main supplies through requisitioning, but we have obtained the powers chiefly so as to make the best use of the timber, plant and labor which are available by concentrating on the best timbered districts, in order to avoid the constant moving about of the plant and labor. The powers we have enable us to do that, and, by so doing, to be fair as between one owner and another. It would be rather hard on the man who is willing to throw his whole possessions into the service of the State if we should have to take nearly all the timber he has got, while his neighbor does nothing. By using in certain cases the powers of requisitioning, we shall be able to ask both of them to make a fair contribution, in spite of any legal and other difficulties which are sometimes found on estates.. It is chiefly these difficulties which stand in the way; it has never been a case of lack of good will. Owners have always been willing to sell, but there have been these difficulties, which the power of requisitioning enables us to get over. We may have to requisition in a case if we know that timber merchants have options on timber, or have made purchases with no possibility of being able to fell or convert either now or in the immediate future. We want the timber now. If the War Office say they want the timber, we shall have to take it, otherwise it would not get converted at all. I want to make it quite clear that it is not intended to use the powers of requisitioning to supply coal mines or railway companies with timber at a rate less than that which allows to the timber owner or dealer a fair profit on his expenditure or work. Perhaps I may be allowed to make one further observation in this connection, which is that the inroads that must be made into our native timber supplies owing to the work of this Committee and otherwise during the war do make the development of a comprehensive national forestry policy at the earliest possible moment after the war a matter of the very first importance.

Tree Felling Contest at the Front

Canadians and Australians Compete—Maoris the Speediest—French Exhibit Their Skill

In a forest in France, during the spring of the present year, the prowess of Canadian, Australian, and French wood-cutters was displayed in a contest, which was of great interest. Describing the event, the Official Correspondent for Australia gives the following descriptive account:—

A contest had been arranged between Australasians and Canadians in France, to decide which could fell trees in quicker time. It began really with the French forest authorities who insisted on the well-known forest rule that no young trees under one metre twenty in girth may be felled after the middle of May, because if you cut the young tree after the sap begins to rise it will not grow again. The British officer in control of the forest had obtained an extension until the end of May, but he had to get felled by then all the young timber which he wanted before the middle of September. He had borrowed some Maoris to help, and he noticed how they cut and the sort of sportsmen they were. He was struck with an idea. "How long do you think it would take a New Zealander to fell that tree?" asked a French forest officer who was with him. "A minute," was the answer. "Unbelievable," exclaimed the Frenchman. A Maori was called up and the tree was down in forty seconds.

After that a contest was arranged between Maoris and French woodcutters. Trees had to be cut in the French style, which, it must be admitted, is much neater and more economical, and about five times as laborious—the trees are cut off at ground level, and so straightly that the stump would not trip you if it were in the middle of the road. Each team consisted of six men, and felled twelve small trees, using its own accustomed axes.

It was out of this that the big contest sprang. The Canadians and Australasians challenged one another. This time the teams were to be three men. Each team was to cut three trees—only service axes to be used. But otherwise each man could cut in any style he wished. The trees averaged about one foot ten inches thick. The teams started to practice—the Maoris for over a month, the others for about a week; and the officer's problem was solved.

The teams tossed for trees and for the order in which they were to cut. I believe that when some question arose out of this toss the Maoris immediately offered to toss again in order to have no advantage from the result.

It was interesting to see the difference of style. All three types of colonial woodsmen cut the trees almost breast high, but the Australian seemed to be the only one who took advantage of that understroke with a hiss through the clenched teeth which looks so formidable when you watch our timber-getters. It was a Canadian team which started. They cut coolly, and the one whom I watched struck one by his splendid condition—a wiry man, not thick-set, but well-built and athletic, who never turned a hair. I thing he was, perhaps, too cool to win. His comrades were not quite so fit as he. They cut the trees with a fairly narrow "scarf," the top cut coming down at a steep angle, and the lower cut coming straight in to meet it, so that the top of the stump, when the tree falls, is left cut off as straight as a table-top. The first tree crashed in fourteen minutes, the next in fifteen, and then they all three tackled the last and toughest, which fell in twenty-one—fifty minutes altogether, when the three times were added.

The next team was Australian. From the first rapid swing one's anxiety was whether they could possibly stand the pace. They tackled the job so much more fiercely than the Canadians. I watched a young Tasmanian, his whole soul in it, sweat pouring from his face. One would have thought that he was cutting almost wildly, till one noticed how every cut went home exactly on top of the cut before. With these Australians—they were Western Australians mostly—the top cut came down at an angle, and the lower cut came up at a similnr angle to meet it, making a wide open angle between the two. The odds would, I think, have been taken by most of those who went there as being in favor of the Canadians, and it was a surprise when the three Australian trees were all down in 31 minutes 8 seconds.

The New Zealanders cut third. Their team consisted of Maoris. They did not seem to be cutting with the fire of the Australians. There was not the visible energy—their actions struck one as easier, and one doubted if their great, lithe, brown muscles were carrying them so fast.

Yet the time told the truth. Their three trees were down in 22 minutes 40 seconds, and no one else approached them. One Canadian team improved the Canadian time to 45 minutes 22 seconds. The Maoris seemed mostly to cut with a narrower scarf even than the Canadians, both upper and lower cuts sloping downwards at a narrow angle.

An Australian won the log-chopping competition. He cut through a 14-inch hornbeam log (the French call it charme), standing on it to cut, in under a minute. And the Canadians won the cross-cut saw contest, with a single-toothed saw, cutting through a 12 to 14-inch hornbeam log in less than 30 seconds. A New Zealander won the competition for style, which was judged by the French Inspecteur des Eaux et Forets, Commandant Delaroche.

The men were mostly sitting watching the Frenchmen, workers in the forest, giving an exhibition cut. Two from a Canadian team were sitting on a log next to me yarning in the slow, quizzical drawl

of the Canadian countryman, when two of their mates sat down beside them. The man next me turned to them and the next moment they were all talking French among themselves—talking it as their native tongue. Their officer, a handsome youngster, spoke it, too. It was not till that moment that I realized that half of these Canadian woodsmen here were French.

Meanwhile, the exhibition chop went on. The French woodcutters were digging at the roots of their trees with long, ancient axes, more like a cold chisel than a modern axe. "I think I could do as well with a knife and fork," said a great, kindly Australian as he watched.

But to my mind that exhibition was the most impressive of all. For every one of those who took part in it was either an old man or a slip of a slender boy. The results were:—

Tree Felling Competition

First Prize—New Zealand (Corpl. Bannister, Pte. Rawiri, Pte. Tamaki), three beeches felled in 22 min. 40 sec.

These trees averaged 24 in. in diameter—quarter girth, 18 in.

Second Prize—Australia (Pte. Anderson, Pte. Church, Pte. Britten), three beeches felled in 31 min. 8 sec.

Third Prize—Canada (Lance-Corpl. Newbury, Pte. Salisbury, Pte. Geon), three beeches felled in 45 min. 22 sec.

Log Chopping Competition

First Prize—Australia (Pte. H. E. Anderson).
Second Prize—New Zealand (Corpl. Bannister).
Hornbeam (Charme) log, 14 in., cut in under 1 min.

Cross-cut Sawing Contest

First Prize—Canada (Sergt. Patton, Pte. Bain).
Second Prize—New Zealand (Ptes. Koati and Tamaki).
Hornbeam (Charme) log, 12-14 in., sawn through in under ½ min.

Exhibition Cut by French Bucherons

First Prize—Berthe.
Second Prize—Desire Albert.

Best Axemanship (Judged by the Commandant Delaroche).

First Prize—New Zealand (Pte. Pouter).
Second Prize—Canada (Pte. Phillipe Flageol).

General Birdwood, General Alderson, and many other distinguished officers were present.

The Logger's Interest in Pulp Wood and Acid Wood

By F. L. Winchester

Logging for the sawmill and logging for the pulp mill are different propositions. The sawmill man or operator can afford to pay more for the delivering of his logs to the sawmill than can the pulp manufacturer. The sawmill operator takes the cream and rich milk, metaphorically speaking, and the pulp manufacturer gets the skimmilk. Or, in other words, what the sawmill operator leaves as not profitable to handle, goes to the pulp mill operator. There are some exceptions to the rule, but it holds good in a majority of cases. It stands to reason, then, that the pulp wood operator cannot afford to go into such expensive methods of logging or getting his timber to the mill as the lumberman.

As a rule in the larger operations for both kinds of timber, the early developments are much alike, viz.: The building of a railroad or tram road for the hauling of timber to the mill or main line of transportation.

From this point, as a rule, the divergence of methods are considerable. The lumber operator installs his skidders and loaders. The pulpwood operator begins to get his contractors on the job. Also: To build V flumes up water courses which are of too steep grades for tram road building.

We will take up this proposition from the standpoint of cut-over operation. This opens the question in two ways. The pulp and acid wood operations following the sawmill logging, the pulp and acid wood operations taking the proposition after the entire lumbering for the sawmill is over. If the sawmill operator gets out the acid and pulp wood for market, it is only reasonable to say that he should follow his logging for lumber purposes with the pulp and acid wood operations as clearly as possible without interference of the one with the other. There are several reasons for this. The logging roads used are in better condition than if left for an indefinite period. There are less burned over areas, probably. If the pulp and acid wood stumpage has any stumpage value after your lumbering operation, the sooner you get that value into money the better. We will say that this stumpage has a value. Then if it has, how can we best handle the getting out of this product to convert that stumpage value into money? This cannot be done in a haphazard way. You need an organization for this work. This organization may be headed by your work superintendent, with an assistant who understands getting out wood.

You have your tram roads in operation, but you need some extra equipment for hauling wood. You cannot haul wood on skeleton logging cars. Equip some of your cars for wood purposes, and it is not a very expensive matter, but unless you do have these wood cars and can keep the wood part of the business going you will find the operation not panning out, as they say. You don't go into a lumber operation without carefully planning the whole system of operating and then get your organization together to carry out the work. This idea should be carried out in pulp and acid wood getting. It need not be on the extensive plan that has been used to develop the sawmill logging, for it is not necessary, and considerable of the development made for your lumbering precludes the necessity of further investment of the kind, for your pulp and acid wood getting. The main item is railroad building. This cost has been charged to the lumbering account. The next thing in order is getting your pulp and acid wood to the railroad or logging road. Contract work now is the proper method, as a rule, to consider. And your pulp and acid wood contractor is not, as a rule, a very reliable man, nor is he of the reliable financial standing that would make it advisable to give him very large contracts. If the stumpage lies up a considerable branch and the watershed of that branch embraces a very considerable area of land, it is very probable that a flume will necessarily have to be built. The operator had best build the flume, for it will, in a majority of cases, fulfill its requirements much better by so doing.

Divide Work Into Small Jobs

Now you are ready to let out contracts. Divide up the area into small jobs and make written contracts with your wood getter. The average man of this business likes to be classed as a contractor, and many of them take a certain measure of pride in being independent. A contractor is his own boss to this extent. Your wood contractors will be coming and going from their jobs to a greater or less degree, but by having a large number of contractors and always some undeveloped wood territory ahead, if the job is fairly well managed, your aggregate quantity of wood coming will be quite satisfactory. But, like any other part of a logging and lumber business, it takes organization and careful directing to prove a success. Your contractors have given acres to cut into pulp and acid wood, and deliver to and load on the cars at so much per cord, and the wood to fulfil standard wood specifications. The contractor may deliver his product direct to the logging railroad, or he may have to skid the logs and poles to places along flume line and cut the wood there and flume it to the road.

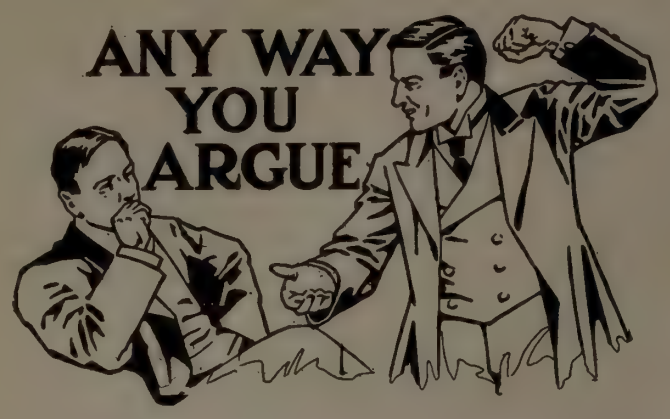
In considering the price to be paid per cord to your contractor it is necessary to know pretty closely costs of the work as it could be done by good workers through the different stages until the wood is delivered on board the wood cars. The flume, as an adjunct to the railroad in pulp and acid wood operations, is a necessity. For short distances, it is much the cheaper way of transporting wood, and with plenty of water, is a most satisfactory way of getting your wood out. In the fall season, when it is dry, and water low, you can facilitate the flume work by building small dams at the head of main flumes or tributaries of the stream leading to the main flume, and hold the water back, letting the water out slowly by means of a little slide gate, allowing just enough to go through to enable you to flume wood comfortably. When the water in the dam is exhausted, close the gate and collect another head of water.

We have now gone through the various stages of the work incident to manufacturing and delivering pulp and acid wood. We now come to the loggers' interest in the matter.

The owner's interest in the stumpage is what profit can be made out of the operation. The contractor's interest is for a job out of which he can make wages. With the owner's side of the question there is the interest in the subject which you take, probably. Most owners are not in business, especially lumbering and logging, as a matter of philanthropy. It is dollars and multiples of dollars that is the consideration.

Is There a Profit?

This fact brings us squarely up to the issue: Can the owner realize something out of his pulp and acid wood stumpage? The answer is: "Yes." With proper management you cannot, in reason, charge any part of the cost of building your railroad to the cost of producing the wood. You can charge a reasonable cost to hauling out your pulp and acid wood and transferring to the main line cars, but such cost should be a comparative one as to value of the total product transported over your road. A reasonable cost for delivering your acid or extract wood, from the stump to the logging cars, ranges from $1.75 to $3.00 per cord, owing to location and conditions, this being considered as being done by contractors. Then you have a small overhead charge for a foreman. This will give you a fair stumpage value under ordinary conditions for your output. You also have produced a good trade for your commissary department, and that trade is worth a considerable amount, for about seventy-five per cent. of the costs of producing your wood goes through your commissary at a reasonable profit.



"There's One Best Way"

There's one best way to buy and sell special lots of lumber, second-hand machinery, timber lands, etc., and that is by inserting a small advertisement in this department.

Every mail brings word of big results from these small ads. Last week a large lumber firm sold their entire 1916 cut, several million feet, through an advertisement on this page.

What Have You to Advertise?

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Wanted—Lath

Please quote us your best cash price on the following, either delivered Cleveland, Ohio, or F.O.B. Mill, giving rate to Cleveland:

⅜ x 1½ — 4 ft. No. 3 White Pine Lath.
Same—Red Pine.
Same—Spruce.
⅜ x 1½ — 4 ft. No. 2 White Pine Lath.
Same—Mill Run White Pine Lath.
Same—Spruce.

THE AMERICAN LUMBER CO.,
1502 New England Building,
12-15 Cleveland, Ohio.

For Sale-Lumber

For Sale

2,000 Cedar Poles 25 to 45 ft. long; 4,000 Cedar Fence Posts 4 in. and up, 8 ft. long; 2,000 No. 2 Cedar Ties, 3 in. face and up. Lynch & Ryan Lumber Co., Marmora, Ont. 12-15

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
6 Montreal, Que.

Wanted-Machinery

Machinery Wanted

One second-hand Alligator. Machinery must be in good condition. Will pay cash. The Field Lumber Company, Limited, Field, Ont. 13-14

Lorries Wanted

Fifteen second-hand lumber lorries, must be in good condition. Campbell MacLaurin Lumber Company, Limited, Drummondville, Que. 11-14

For Sale-Machinery

For Sale

Gasoline Engine, almost new, a bargain. Write Box 420, Canada Lumberman, Toronto, Ont. 13-13

For Sale

One 30-in. Double Surfacer; one 6-in. Four Sided Moulder; one Self Feed Rip Saw; one International Gas Engine, 12 Horse Power; one 50 Horse Power Corliss Stationary Steam Engine; all in first class working condition. Apply Box 421, Canada Lumberman, Toronto, Ont. 13-14

Timber Limits and Mills

Timber limits for sale in the District of Algoma, also a Band and Gang Saw Mill. For particulars apply to Geo. Niebergall & Son, Parry Sound, Ont. 11-13

Machinery for Sale

Complete Sawmill Outfit; One Hundred and Twenty-five H.P.; Single Circular; Steam Feed; Nigger Log Turn; Live Rolls; Four Saw Edger; Dutch Oven; Perkins Shingle Rig, including Cut-off and Jointer. Everything in first-class condition. Building also if desired.

McCAMUS & McKELVIE,
13-13 New Liskeard, Ont.

Machinery For Sale

One 26-in. Double Surfacer, Cowan.
One 6-in. four-sided Moulder, Cowan.
One Arm Sander, heavy type, nearly new.
One Power Feed Rip Saw.
One Steam Engine, Wheelock, 15 x 36.
One Steam Tubular Boiler, 4 in. x 14 in. Government certificate with same; 84-3-in. Tubes.
Or exchange for lumber.
T. H. Hancock, 1372 Bloor Street West, Toronto, Ont. 13-13

Machinery For Sale

A small "Ad" under this heading, telling of what machinery you have for sale, will immediately put you in touch with buyers. Send us a list of machinery items and we will quote you on a small "Ad." Send the list now, before you forget about it. 1-t.f.

FOR SALE

Woodworking Machinery

1 Woods No. 32 Matcher; 1 Goldie 10-in. Moulder; 1 Goldie 24-in. Matcher; 1 Cowan 42-in. Sander; 1 Jackson Cochrane 36-in. Sander; 1 Egan 36-in. Single Surfacer; 1 McGregor-Gourlay 2-drum 30-in. Boss Sander; 1 Egan 30-in. 2-drum Sander; 1 CMC 8-in. 4-side Sticker; 1 McGregor No. 212 30-in. Double Surfacer; 1 No. 180 Berlin 30-in. Double Surfacer; 1 American No. 26 Hardwood Matcher, with boring attachment and end matcher; 1 Ballantyne 12-in. Sticker.

P. B. Yates Machine Company, Limited,
13-t.f. Hamilton, Ont.

Machinery For Sale

Woodworking Machinery for sale, consisting of Planers, Band Saws, Hardwood Flooring Machines, Mortisers, Buzz Planers, Shapers, Mitre and Tennoning Machines, etc., also Steam Boilers and 300 H.P. Steam Engine, Shafting, Pulleys, and large quantity of leather belting. Also a complete Sawmill outfit, a large stock of Rough and Dressed Lumber, Sashes, Doors, etc., manufactured and in process of manufacture. Reply to the Tobin Manufacturing Company in Liquidation, Bromptonville, P.Q. 12-15

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

WANTED—Position by a first-class Accountant and office manager. Lumber business preferred. Acquainted with all departments of office work in connection with the lumber manufacturing business or lumber yard. Am capable of taking charge of any set of books. Fifteen years' experience. Married, 38 years of age. Strictly temperate and reliable. Best of references. Am employed now on monthly engagement. Apply stating salary and particulars to Box 419, Canada Lumberman, Toronto, Ont. 12-13

BAND OR CIRCULAR FILER or Mill Foreman wants position. Twenty-seven (27) years' sawmill experience. Gilt edge references. Box 405, Canada Lumberman, Toronto, Ont. 11-1

Business Chances

Timber Tract and Mill

Valuable Timber Tract, British Columbia; nearly 10,900 acres; 60,000,000 feet of timber; on railroad. Local market for mine props. First class mill, 30,000 feet daily capacity. Very attractive proposition. George W. Grant, P. O. 1676, Calgary, Alta. 13-13

Timber Limit For Sale

Thirty-six square mile limit, North Shore, License allows cutting all kinds of timber. Contains Hemlock, Birch, Spruce, Pine, Cedar Ties and Poles, Pulpwood and Hardwood. Railroad runs through part of berth. Cheap operation. Splendid opportunity for small mill. Apply Box 423, Canada Lumberman, Toronto, Ont. 13-t.f.

Business Opportunity

Make your opportunity knock at the door of every Lumberman in Canada by placing a small "Ad" about it in this column. Our rate is $2.10 per inch per issue. Now is a time when monied men are seeking good bargains. What have you to offer? 1-t.f.

Saw Mill

For sale on Muskoka Lakes, saw mill complete; daily capacity 20,000 feet. Good trade connection; plenty of timber available. Rare opportunity. Must be sold. Owner deceased. Terms reasonable. Box 418, Canada Lumberman, Toronto, Ont. 12-15

For Sale

To close an Estate, the valuable Lumber Mill known as the Picnic Island Mill at Little Current, Ont., Georgian Bay, is offered for sale. Capacity about twenty million feet of lumber per season. Extensive docks with sixteen feet of water and booming capacity for about fifteen million feet of logs.

Picnic Island, which is freehold property, consists of thirty-seven acres, containing the mill and twenty dwelling houses for employees. Superior drying grounds. Can ship by rail or water. For further particulars write,

James Battle, Thorold, Ont.
Administrator Estate of Late John Conlon,
or
Thomas Conlon, 44 Church St.,
10-13 St. Catharines, Ont.

Canadian Industry, Commerce and Finance

Canadian business men, and those in other countries doing business, or prepared to do business in Canada, have felt the need of a concise and accurate source of information concerning Canadian industry, commerce and finance. Such a volume has just been prepared, and published by the Industrial and Educational Press, Limited, 45 St. Alexander Street, Montreal.

The opening chapters of the book are devoted to a discussion of modern business methods as applied to Canada, in which the author deals with the three divisions—industry, commerce and finance—in a lucid and authoritative manner. The aim is to present the information in such a way as to make it easily comprehensible. The volume is of particular value to the young business-man and to foreigners doing business with Canadian merchants. The information is especially useful to Canadian merchants at the present time when so many firms are beginning to do an export trade, to which a considerable portion of the book is devoted.

First chapter on industry deals with each of the various branches of Canada's industrial development, in point of extent, production and possibilities. In his treatise on commerce the author treats the subject in all its phases, foreign commerce, domestic commerce, ocean transportation, inland water transportation, railroads, etc., are taken up in turn and the methods and terms explained. The various markets of the world are described, and a section is devoted to weights and measures in use the world over. The chapter on finance deals with a wide array of subjects. The author first describes the development of banking and instruments of credit, and then deals with all methods in present use, describing each separately—foreign exchange, bills of lading and shipping receipts, etc., mortgages, liens, deeds, stocks, bonds, and all classes of insurance are given attention in this chapter.

Another useful and principal feature of the volume is the trade index or directory of all marketable commodities and Canadian producers. This list embodies a description of most commodities and accurate lists of the Canadian producers of each, with addresses.

The book is published by the Industrial and Educational Press, Limited, Montreal, as a companion volume to the Journal of Commerce, of which the Hon. W. S. Fielding is President and Editor-in-Chief.

The Fire Season On in B. C.

Recent reports received by Government Timber Inspector Geo. D. McKay, at Vancouver, B. C., state that there is danger of serious forest fires in British Columbia this summer, unless plenty of rain comes soon. Several fires are already reported in various parts of the province, and everything is being done to prevent the outbreak of fires. The most serious fire so far is one reported from a little south of Port Moody, during the third week in June. Other fires are reported from the Squamish, Powell River, Texada Island, Green Point Rapids, Blubber Bay, Wolfson Bay, Cortex Island, Campbell River and Rock Bay. A report from Victoria states that many settlers have been burned out by serious forest fires in the Fort George and Hazelton districts, but that not much valuable timber has been destroyed as yet.

Want Subsidy on B.C. Shipments

At a recent meeting of the British Columbia Lumber Manufacturers' Association, held at Vancouver, B.C., the following resolution was passed:—

"That it is the opinion of this meeting in respect to Bill No. 43 now pending before the House, while an effort in the right direction, and should be of general benefit to the Province and the Government is to be congratulated to that extent, yet it does not go far enough, and we would suggest that a section should be added whereby a subsidy of $1 a ton deadweight should be paid to the manufacturers shipping British Columbia products on ships built in British Columbia. This, in our opinion, would stimulate the exportation of our products on British Columbia ships and materially assist the successful operation of a merchant marine.

Fort George Prospects

The Minister of Lands for British Columbia reports that while no sawmill timber is being logged in the Fort George forest district, present operations being confined to the taking out of timber for bridge and road construction, mining development and cordwood, the future of the lumber industry in that country is looked upon as being hopeful. The prairie demand for lumber has enabled one firm to resume cutting from a stock of logs which has been on hand for years, while another concern is preparing to start up again. The recent reduction in the freight rate on lumber between that district and Edmonton will have a favorable effect, and encourage the mills to cater for other than local needs.

A despatch from Niagara-on-the Lake under date of June 23rd states that requirements for men who desire to enlist in Forestry Battalions are to be relaxed in the case of laborers, to include men up to forty-eight years who may have lost a finger on either or both hands, or one or two toes, providing the lost digits are not great toes or thumbs. The test of eyes is also to be reduced.

Review of Current Trade Conditions

Ontario

Weather conditions have been altogether against the lumber trade during the past fortnight, and unless a great change for the better takes place within a very short time, it is certain that there will be nothing to report in the way of good trade for the early part of the present summer. So general and continuous has the bad weather been that farmers are far behind in their operations. Their seeding has been delayed in the great majority of cases and very few farmers are giving any consideration to their requirements in the way of lumber. Had there been a good season for seeding they would have been in the market for considerable quantities of building materials, as most of the Ontario farmers are well to do and can afford to make a number of improvements to their buildings. Now, it is probable that most of this work will be postponed for another year and the retail lumbermen will be minus just that much good trade.

As there is little in the way of house building in progress in the cities and as the country district trade is so quiet, the chief sources of business now are the requirements of manufacturers who consume lumber as a raw material, and the warehouse, factory, and public building work in the cities. In Toronto, there is a moderate amount of work of the latter description in progress, which is keeping stocks on the move to some extent, although it is only a fraction of what it would be under normal conditions. In the other cities of Ontario a small amount of building of this class is also reported.

Manufacturers of furniture and musical instruments continue active and their lumber requirements are fairly large. The munition box industry has come to the front again with extensive requirements in connection with the contracts which were let during the month of June. Just to what extent this business will be a source of profit to the box manufacturers and the lumber producers and wholesalers, is a matter of considerable doubt, as the prices are admitted on all sides to be so close as to make the proposition a questionable one from the manufacturing point of view. However, one satisfactory result will be the actual consumption of considerable quantities of stock which might otherwise be holding the market down.

The hemlock trade is only fair and it is difficult to dispose of anything except No. 1 stocks.

Eastern Canada

The letting of extensive shell box contracts, of which considerable quantities have gone to Montreal firms, is the most important event in connection with the lumber trade in that city during the past few weeks. Tenders are also being called for a large quantity of rifle boxes, and the trade expect that between these two lines the movement of lumber will be pretty satisfactory for a few months. The building trade at Montreal shows no improvement. The export trade with the United States is moderate in amount. The export trade to the United Kingdom has recently experienced an important reduction in the cost of ocean freight space. Rates declined 90s. per standard within one week and are now quoted at 275s. This is the result of the Government having released a number of vessels, and also is partly due to small offerings of grain. Quite a quantity of lumber is being exported.

At St. John, N.B., the trade has fallen off considerably during the past fortnight. Practically no new buildings have been announced and the prospects in this direction are not bright. Prices locally are somewhat easier. Refuse stocks are too plentiful, and there is not much demand for boards. The United States demand for boards is also very weak and prices are easier. Lath are inclined to be weaker. The English market has fallen off £3 to £4 per standard and deal buyers are hesitating about making contracts for future delivery. Freights are a little easier.

The best price for spruce frames at Boston has been shaded a little and they are now offered freely at $26, while some business is reported at $25.50. There is a better demand for random than for frames, and quotations are:—2 x 3, $20.50 to $24; 2 x 4, $21.50 to $22; 2 x 5 and 2 x 6, $21 to $21.50; 2 x 8, $24.50 to $25; 2 x 10, $26 to $26.50; 2 x 12, $27 to $27.50. Good covering boards 5 in. and up wide, 8 ft. and up long are bringing $21.50. Matched boards in stock lengths are offered at $25 to $26. Eastern hemlock prices are steady at Boston and the volume of trade is fair. Some eastern hemlock manufacturers are quoting $22.50 on clipped boards, stock lengths. Others will take $22 and some fair boards may be had at $21.50.

There is a fair demand for shingles at Boston and the removal of railroad embargoes is permitting a free movement in southern New England territory. Some good makes of white cedar extras are quoted at $3.50. Clears at $3.60 and at $3.55. Fairly good extras may be had at $3.50. Clears are firm at $3.20 to $3.30. Red cedar shingles are not plentiful and are firm. The best makes are bringing $4. The demand for lath at Boston is fair and stocks are plentiful. The price fo 1⅝ in. is about $4.10 and for 1½ in. $3.75 to $3.80.

United States

The lumber trade situation in the United States is in a rather uncertain condition at present, many manufacturers having developed an opinion that it would now be wise to curtail production, on account of a falling off in the demand for southern pine. An increasing number of manufacturers are following this plan, the curtailment varying from 15 to 30 per cent. and averaging about 20 per cent. The indication is that the curtailment will shortly be quite general. During the week ending June 9th the actual production of 157 southern pine mills was nearly eight per cent. below normal and 1.33 per cent. less than shipments. Reports from manufacturing centres in the Southern States show that an early buying movement is likely to develop. An improvement is reported in the car situation, a number of mills reporting that they are receiving as many cars as they can use. There is a better demand for timbers, particularly for railroad material. The export trade to Great Britain also shows a little improvement with increased parcel shipments, following lower quotations by the regular liners. Sales of yellow pine have recently been at figures indicating a reduction of about 50 cents per thousand.

On the west coast, production has also been in excess of demand until quite lately, and lower prices are reported. Curtailment of output is being brought about in that territory also. The demand has shown a considerable decrease and many of the mills in the Pacific Northwest are likely to be closed down for two or three weeks after the 4th of July. A number of manufacturers are also thinking of operating their mills only five days a week until the situation has improved and approached normal again. Continued lack of tonnage and high prices for ocean freight space are keeping down the Pacific export trade. There is unusual activity in all Pacific Coast ship yards in the production of wooden vessels for the lumber carrying trade.

Northern hemlock and hardwood manufacturers are experiencing a serious shortage of labor for the operation of mills. The shortage is an actual shortage of men and has nothing to do with the question of wages. Munitions and industrial plants are offering such high wages that men are leaving the sawmills in considerable numbers. This is already bringing about an enforced curtailment and may soon have a stiffening effect upon the market.

The trade in northern pine at Chicago is quiet, both for country and city yards. At Buffalo, wholesalers report many orders for northern pine on their books and are expecting an improvement as soon as good weather seems reasonably assured. The frequent rains have kept down the volume of building operations. There is a fair movement in the better grades, and the lower grades are about steady. An active market for northern pine is reported from North Tonawanda. Arrivals by lake are more numerous and orders are increasing, so that stocks are moving extensively almost direct from the vessels. Upper grades are stronger, and prices in general are steady.

Great Britain

The lumber trade at London has been very quiet for a few weeks past, chiefly as a result of the remarkably high cost of ocean freight, and the outlook is that similar quietness will continue so long as freight rates remain at a high level, because importers are not inclined to take much risk with so uncertain a market in front of them. Fairly extensive deliveries from the London docks are reported, but not nearly so great as they were a year ago, when housing material was required for the new armies. Dock stocks, however, continue quite extensive and fresh arrivals are preventing them from running down to any extent. Values show little or no change, but have no tendency to increase. In fact, it is expected that an opposite tendency will develop before long as the average requirements are not increasing. At the latest auction sale, prices were not so firm as they had been previously and buyers were quite reluctant about the top prices. Delivery at London docks during the week ending June amounted to 4,315 standards, as compared with 5,885 standards during the corresponding week of 1915. At Churchill and Sim's recent auction sale 3 x 11 third Montreal pine sold at £33 and £32 10s. 3 x 11 first Quebec spruce brought £34. Unsorted St. John spruce, 3 x 11, brought £31, and third 3 x 11 spruce from Three Rivers brought £30 10s. A parcel of 3 x 9 third red pine, 12 to 16 feet, from Montreal, brought £28 5s.

Quiet trade has been the rule at Liverpool during the last month

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

Arrivals have been moderate and deliveries generally fair. Tonnage has been offered a little more freely. Current c.i.f. values for spruce deals are still firm and the outlook is for a continuance of this condition. The tonnage situation in connection with the Liverpool trade is showing improvement. Freights have eased a little and a fair amount of tonnage has offered. Ship owners are less exacting in their rates and tonnage available is usually for prompt shipment. Recent liner parcels arriving on consignment have not brought quite as high figures as former ones. The spot market for spruce at Liverpool is firm and holders are not cutting values. Consumers are commencing to show a little more interest about future prices in view of the possibility of easier freight rates causing prices to drop. However, it must be remembered that cargoes on which top freight rates have been paid are only just coming on the market. Consumption is good to-day, but it is chiefly for Government requirements. Heavier arrivals are expected during the next few weeks.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Uncertain Trade Conditions at St. John, N. B.

St. John, N.B., June 23.—(Special to the Canada Lumberman).—Locally, the lumber trade market has had quite a setback during the past two weeks, and so far as material for building in and about the city is concerned, it has become a pretty hard seller. The month of May was a month well up to the average of any good year. As a matter of fact, it was much better in many cases. Practically no new buildings have come on the market during the past two weeks, and the future looks doubtful, although these days one can never tell what will happen. If a turn for the better should come in the war it will no doubt stimulate people to open up real estate propositions and give a stimulus to building, but this is unlooked for at least for some months to come. Prices locally are not as good as they were. Stocks of refuse lumber are excessive. Boards are not in demand, going steadily downwards, as they did last season, but should any demand arise for them, the price would no doubt go up. Last season the Admiralty stepped in and purchased large quantities for huts, but this year, so far, very few orders have come on the market for boards.

The American market for boards, as well as everything else, is weakening, and at present, indications are that the market will slide off for some time to come. During the winter and spring it showed signs of good things for summer months, but it has not lived up to the indications. At Boston to-day the base price is not over $24.50, and no doubt further concessions will be made.

Laths are also following the downward trend, but not to such an extent as long lumber. At present, lath are not worth over $2.50 f.o.b. St. John, but stocks are held largely in a few hands and this will no doubt be a steadying influence on the market.

The English market is said to have fallen off £3 to £4 per standard; this has made the deal buyers hesitate in buying anything more for future delivery.

Freights are somewhat easier, but in the same dangerous position as for some months. A charter was said to have been made from St. John at 300 shillings, which is considerably under the last quotation. Short lumber prices remain firm in shooks and shingles.

The mills are all sawing, but many are short of logs and no doubt will close down early.

The drives in the river are coming along in good shape and with the present pitch of water all logs in the main river should be in booms before many days.

Shell Box Contracts Helping Montreal Trade

Montreal, June 26.—(Special to the Canada Lumberman).—The most important factor in the last fortnight is the letting of shell box contracts by the Imperial Munitions Board. Montreal firms have their share of the orders, two companies obtaining orders, each for 300,000 boxes, which are of a new type so far as Canada is concerned, and in which a considerable amount of three-ply material is used. The Imperial Munitions Board has also called for tenders for a large quantity of rifle boxes, the specifications for which are stated to be very stiff. A contract for shooks for 400,000 boxes for a British firm, provisionally placed in Montreal, was subsequently cancelled on the ground that the price was too high. Many inquiries from Ontario have been received, asking for quotations on suitable box lumber, but it is said that there is some difficulty in quoting in view of the continued scarcity of certain descriptions. Apart from the box there is no change in conditions. The building trade is much about the same, and there is no prospect of any substantial improvement. Most of the permits are for small houses.

A fair amount of business is being done with the United States. Barges are scarce, owing to a break in the canal, and with lumbermen bidding briskly for the boats available, freight quotations have advanced from $2.50 to $3.50 per 1,000 feet.

In the matter of freight charges, the United Kingdom export situation has undergone a quite unexpected change. Rates dropped 90s. per standard within a week, and at the time of writing stand round about 275s. This is due to the release of vessels by the Government, but more particularly to the insignificant amount of grain offering. The shippers of the latter commodity are holding off, owing to the smaller demand from the United Kingdom, and as lumber rates are largely affected by the quantity of grain shipped and the rates, there has been a sympathetic downward movement in the charges for lumber. A considerable quantity of lumber is being exported, some on contracts made at the high figures prevailing at the beginning of the season, but firms are not disposed to book heavily ahead on a falling freight market. Some extensive shipments of birch have been made.

The sulphite pulp market is again very buoyant. The demand is as urgent as ever, and European supplies are by no means adequate. Mechanical pulp is also a stronger market, while news print is in good request.

Atlantic Freight Rates Easier

Alfred Dobell & Company, Liverpool, Eng., in their timber market report, under date of June 1st, report as follows:—

Spruce deals.—There is less inclination to buy, and current values are easier in consequence. Freights from the spruce ports are also easier, but in view of the general scarcity of tonnage it is probable that this feature may be only temporary.

Douglas Fir.—The arrivals have been limited to carload lots shipped via the Atlantic Coast ports per liners, and which have gone direct into consumption. The stocks held are a negligible quantity. In consequence of the continued difficulty in securing freight room, forward business is practically at a standstill.

Liverpool Market Report

Smith & Tyrer, Limited, Liverpool, Eng., report under date of June 1st as follows:—Both values and freights have an easier tendency, and there is a slackening off of the tension, which has been a feature for some time past.

Spruce deals have kept very firm until recently, but a slackening in the demand and lower freights have weakened prices. It seems possible that we shall have a lower range of values for a time, with an improvement later. Hemlock moves off quickly, but without any demand. Birch.—The withdrawal of the prohibition on timber is a relief to the Canadian shippers, and hopes are entertained that the prohibition on planks will also be withdrawn. Pine is without change and firmly held. Pacific Coast woods.—There has been more doing, space being available to a limited extent.

London Market Report

Churchill & Sim, in their montly wood circular, under date of London, June 5th, report in part as follows:—There has been a reduced importation of wood into London during May, and the aggregate of the overside delivery has amounted to some 8,000 standards only, as compared with 13,000 in May, 1915. The general tone of the market has been weaker; buyers having become uneasy and nervous of future developments. This attitude seems largely the result of the action of the Swedish shippers, who delayed the abandonment of their rigid terms of business until the ports were open; this was followed by considerable pressure to sell, and unfortunately coincided with a time when circumstances connected with the demand, a partial easing off in freight rates, and an uncertain outlook in both these directions in the immediate future, were bringing about a feeling of indifference among importers.

On broad principles it may safely be said that, with so many wood producing districts shut off from participating in the supply, there is again little danger of overproduction this season, and given a continuance of a normal demand, the future course of the market rests to a great extent upon the question of the rates of tonnage.

From the St. Lawrence there has been imported—

J. & D. A. Harquail

Company, Limited

Manufacturers of Lumber

Extensive New Brunswick and Quebec timber limits, abundant with Virgin Spruce, Pine and Hardwoods.

Twenty years' experience in Milling and Manufacturing, together with a practical knowledge of Building and Architecture, is why our Customers tell us that the Dressing, Grading, and Manufacture of our Stock is just a little better than they expected.

Large stocks of 1 in. Spruce Lumber always on hand.

Try a car of our Air-dried Dressed Spruce.

We also make a Specialty of Kiln Dried Stock.

Our personal attention given to every detail.

Write, wire or phone us for quotations.

Established 1894 ***Incorporated 1908***

Campbellton, New Brunswick

Pine Deals, 11,000 pieces; against 5,000 pieces in 1915.
Spruce Deals, 17,000 pieces; against 21,000 pieces in 1915.
Birch Planks, none, against 1,000 pieces in 1915.
and from New Brunswick, etc.—
Pine deals, 4,000 pieces; against 3,000 pieces in 1915.
Spruce deals, 303,000 pieces; against 1,056,000 pieces in 1915.
Birch planks, 28,000 pieces; against 30,000 pieces in 1915.
The season is only now opening from the St. Lawrence, and the importation is negligible so far. There is no change in the prices for pine deals, but spruce are a little weaker. Importations from the lower ports was on a very moderate scale during May, and buyers generally are showing no anxiety to secure stock; steamer freights are lower, owners' conditions being so onerous that importers are disinclined to take the risks incident to the possibility of another experience of congested ports and a depleted labor supply, at all events in the present state of demand.

Market for Canadian Timber in India

Limited Consumption and Indifference of Canadian Exporters Responsible for Smallness of Trade—Openings for Some Canadian Stocks

By H. R. MacMillan*

The use of timber in India is extremely limited. The annual per capita consumption of timber, including all forms of rough wood used for fuel and other purposes, is estimated to be 1½ cubic feet, of which four-fifths is used for fuel. The total quantity of timber used, aside from fuel, is 96,000,000 cubic feet, equal to about 960,000,000 feet board measure, or three board feet per year per head of the population. By far the greater part of this is used in the form of rough logs and poles for building purposes.

The use of imported timber is confined exclusively to the industrial centres, railroads, public works and military necessities. The agricultural population uses absolutely no imported timber.

That Indian forests are able almost completely to meet the requirements of the country for timber is due to the splendid forest administration inaugurated by the British Government half a century ago. About forty per cent. of the country is under forest. The whole of this area is administered carefully to prevent destruction by fire and overcutting, and although at the time of British occupancy the more accessible forests had been almost ruined, wise management has already greatly increased their productivity. There still remain in some provinces, notably in Burma, large areas of hardwood forest, suitable for industrial purposes, which through lack of capital, suitable machinery and equipment have not been rendered accessible.

It is natural to find, therefore, that the timber imports of India, aside from teak, which is brought in from Java and Siam to the extent of $800,000 to $1,250,000 yearly, consist almost entirely of rough lumbers for temporary uses only, or manufactured wooden articles introduced by Europeans or rendered necessary by the development of industries.

So far as can be learned, the total export of rough timber from Canada to India during 1913-14 consisted of a cargo of railway sleepers sent in 1914. After railroad sleepers the most important item of Indian timber imports, from a Canadian standpoint, is that classified in India as deals and pine. The imports of deals and pine, which include all soft coniferous lumber, in the form of timbers, dimension, rough or dressed boards or box shooks (excepting tea chests) during 1913-14 were drawn from the following countries:—

	Feet Board Measure
United States	12,556,000
Austria-Hungary	3,785,000
United Kingdom	2,546,000
Norway	1,484,000
Sweden	863,000
Others	257,000
Total	21,491,000

Douglas fir constitutes about 57 per cent. of the total softwood imports of India. This is due to the fact that it more completely fills the requirements of the Indian market than any of its important European competitors.

Whenever permanent buildings and structures are being erected in India, whether in the large coast cities, on important public works or in smaller towns, the presence of white ants prevents the use of timber. There are no wooden floors in India and the only wood found in a building is in the doors, door frames, sash and window frames and, in the older buildings, beams and joists. Everything else is brick, stone and cement. Modern buildings are built with steel joists. Ant-proof timbers only are used in buildings. None of the imported softwood timbers are ant-proof. The same policy is followed in railroad construction, the sleepers are frequently the only timber on the railroad.

The rolling stock, station buildings, workshops, bridges, are metal, brick, stone and cement.

The imported softwoods are restricted in use to supplying timber for falsework, for remanufacture into articles of temporary use or for use in the extremely few situations free from white ants.

*Special report in the Weekly Bulletin of the Department of Trade and Commerce.

Douglas fir is the only timber procurable in the long lengths used for falsework in bridges or large buildings. Even in the sizes in which Indian hardwoods can be secured for this purpose Douglas fir is preferred because it is lighter to handle and more easily worked, with the exception of one or two very conservative and prosperous railroads still using teak at $100 per thousand for falsework where Douglas fir could be purchased at $33. Douglas fir is now in universal use for temporary construction purposes.

Douglas fir has also been the favorite timber for use by the military and naval authorities in temporary bridgework, fortifications, pontoon building and refitting troop and remount ships in connection with the various expeditions constantly on foot in India. Large quantities were used in the Mesopotamian expedition until the exhaustion of the stocks in hand led to the substitution of teak.

The merchants carrying stocks of Douglas fir in India have relied chiefly upon the railroad, public works and military demand. The presence of the stocks in the country has gradually led to the use of the timber for other purposes. It was, until the exhaustion of the stocks during the present year, the most popular timber in India for shell boxes at the Government and other shell factories, and was also used extensively in private trade for packing cases. Boards and planks are purchased by boxmaking companies and resawn by hand at a cost of about $10 per thousand for the manufacture of candle boxes and machinery crates. A constant demand has arisen from the five principal harbors where it is the chief timber for hatch covers, gangways, fenders and temporary piling. Small quantities of Douglas fir are manufactured into cheap furniture. Very little of the timber is sent inland from the ports, except as it is needed for special construction work.

No stocks are carried anywhere in the interior of India. Aside from falsework the only market found in the interior of the country has been for drying room floors in the tea gardens, a use for which Douglas fir has given good satisfaction.

Though many uses have been found for Douglas fir in India the total quantity of fir imported annually must remain as at present comparatively small because of the limited industrial development of the country. The Indian market is, however, extremely important in that it shows the excellent reputation which it is possible for Douglas fir to earn in a tropical climate. The climate of India is much more severe on timber than the climate of South Africa. Nevertheless, Douglas fir is used throughout the country for temporary bridges and no complaints have arisen concerning strength or suitability. Though for some years Douglas fir has not been accepted in South Africa for refitting transports, it is the most popular wood for this purpose in India. The different opinions held in South Africa and in India concerning the fitness of this timber for identical uses in the two countries illustrates the extent to which the use of wood is built upon first impression and upon prejudice.

An excellent instance of the life of Douglas fir merchantable timbers in a tropical climate was provided recently in Calcutta when timbers which had been in use for six years or more on different contracts for falsework were sold for resawing. The timbers though checked were sound and in good condition. No trace was discovered anywhere of Douglas fir having been affected by dry rot in India. This bears out the opinion expressed concerning the occurrence of dry rot in South Africa, that it develops in cargoes making long passages in sailing vessels. The shipments of Douglas fir to India are nearly all in steamers making the passage in less than two months.

The prospects for the development of valuable Canadian trade in Douglas fir to India depend upon two factors:—

1. Competition with United States shippers.
2. An increase in the use of Douglas fir.

Competition with United States

India is probably the only country importing Douglas fir to any extent, in which Canada has not maintained a share of the business. All the Douglas fir imported to India has come from the United States.

484 Richmond Street, West, TORONTO

The importers in India have even been under the impression that no Canadian ports were in a position to export Douglas fir cargoes. Of all the managers of timber importing companies in India only one, when directly asked, was aware that cargoes of such timber as they secure on Puget Sound could be secured with equal satisfaction and despatch from British Columbia. Even this gentleman had only learned within a few months that Douglas fir could be secured in British Columbia. This incredible state of ignorance on the part of the Indian importers can only be understood when the manner of handling the business is known.

There being no liner service from the Pacific ports of North America to India the timber trade is entirely dependent upon tramp cargoes. The importation of Douglas fir is therefore in the hands of companies strong enough to finance cargo shipments and carry the stocks for the year or so necessary to turn over a cargo in the Indian market. There are only five or six such companies in India. All are large trading companies interested in jute mills, coal mines, general engineering, importation of cotton piece goods, railroad construction, etc., with whom timber is only a side line. The timber branch of the business is in the hands of a subordinate employee of office experience. North American purchasing agents of these companies are located without exception in the United States. The timber buyers in India have not had any inducement to inquire if they could secure their supplies from brokers or shippers in Canada and no Canadian shippers have made any effort to get into the Indian market. Within the last few months the situation has slightly improved. One of the leading importers has established connections with a Canadian company and several others are desirous of doing so. The names and North American buying connections of the Indian importers of Douglas fir have been sent to the Commercial Intelligence Branch of the Department of Trade and Commmerce, Ottawa.

Once relations are established so that Canadian exporters secure inquiries sent out from India there should be no difficulty about securing a good share of the business. The sentiment of the importers is all in favor of buying in Canada if prices are equal.

The usual cargo imported to India is 2,500,000 to 3,000,000 feet. The specification as a rule calls for nothing but merchantable, a grade which has been found satisfactory for the uses to which Douglas fir has been put in India. One-third of the cargo is ordinary timbers, the remainder consists of a small quantity of 5/8-inch by 6-inch, 1-inch by 6-inch, and the balance in 1/2-inch, 1-inch, 1 1/2-inch, 2-inch, 3-inch, 4-inch, 5-inch, and 6-inch by 12-inch in 16-foot to 30-foot lengths. The importers do not do a retail business. Very rarely does any one importer bring in more than one cargo a year. The timber is carried in stock several months at least and is seldom carefully piled or protected from the weather.

A large proportion of the Douglas fir imported is resawn. All resawing is done by hand with whip or frame saws and costs about $10 per thousand feet. If the specifications were varied so as to decrease the amount of sawing in India the cost of the timber would be decreased. As a matter of fact, however, the interest of the importer lies in the other direction, his chief concern is to make his stock suitable for all needs. He accomplishes this by carrying a larger proportion than is really necessary in timbers which can be cut down to any size. The profit on handling Douglas fir is attractive, there being only a few firms in the business the competition is not ruinous.

The timber is usually sold out of the yard at $5.30 to $11.60 per thousand feet more than the landed cost in addition to any charges for resawing. Very much larger profits have been made during the past few months because of freight increases. The stocks now remaining in India (March, 1916) are held at $78.30 to $96.60 per thousand feet for merchantable. The ordinary selling price for merchantable was in normal times $30 to $35 per thousand feet. All timber in India is bought and sold by the ton of 50 cubic feet, equivalent in sawn and square timber to 600 board feet.

Increased Use of Douglas Fir

The increased use of Douglas fir is dependent on the decrease in the use of Scandinavian and Austrian timber and the increased industrial development of India.

Scandinavian and Austrian pines, which were in normal times higher in price than Douglas fir, owed their ability to compete to the fact that they could be imported by persons of limited capital or credit in small portions by liner shipments, and that they were used for packing cases, chiefly in the textile industry. Austrian pine was imported chiefly to Bombay, in rough planks, 1-inch x 3-inch x 12 feet at about $33 to $42 per thousand feet. Scandinavian timbers, which were used to a limited extent dressed and matched, were imported at about $45 to $50 per thousand.

The best prospect for meeting the Austrian and Scandinavian competition, including the importations of Baltic timber via the United Kingdom, which is centred chiefly in Bombay, is by the introduction of British Columbia spruce both in merchantable and dressed. When working arrangements are completed with Bombay importers, quotations should be submitted for rough spruce planks 1-inch—3-inch x 12-inch x 12 feet, 3-inch x 9-inch x 12 feet and for dressed spruce 5/8-inch x 6-inch x 12 feet, so that trial shipments could later be made with Douglas fir cargoes.

Important increases in the use of Douglas fir in India, aside from railway sleepers, may only be expected with further industrial expansion. Every effort is being made by the government and by private initiative to prepare for industrial development after the war. There are still many resources undeveloped, extensive railroad systems yet await completion; the labor reserves of the country, the astonishing fertility of the land, are assets which render assurance that industrial expansion, even if delayed, is inevitable.

About 20,000,000 feet of mixed hardwoods, classified in the table of imports as "other woods," are imported annually, chiefly from the neighborhood of the Malay Peninsula. These woods are cheaper than Douglas, costing $16.80 to $27 per thousand feet c.i.f. Indian ports. They are suitable for use only when small sizes are needed for crating, packing, or temporary purposes. The forest areas from which these woods are drawn are extensive but have not yet been developed on a commercial scale. The timbers are not so popular as Douglas fir. These timbers benefited greatly by the high freights which have kept Douglas fir out of the Indian market during the past year.

The quantity of Douglas fir sold in India yearly would not be in any way affected if the price were increased at the port of shipment by $5 per thousand feet. There are no competing timbers which would replace Douglas fir in uses for which Douglas fir is now purchased.

The Japanese are, during the war, making a determined effort to put rough lumber on the Indian market. Though the Japanese lumber exporters appear in some unaccountable manner to quote c.i.f. prices to India which appear entirely out of keeping with the freight rates quoted elsewhere for equal distances, they have not arranged much business. The prices quoted c.i.f. Calcutta, February, 1916, are $31 per thousand feet b.m. for Hokaido pine 12-inch x 12-inch x 8 feet and up and $53.50 per thousand for the same timber 1-inch x 6-inch x 8 feet and up. This wood resembles spruce merchantable in appearance, quality and uses. Oak and ash are also quoted. The mills making the quotations claim export outputs varying from 150,000 to 400,000 feet per month.

The c.i.f. prices quoted would be possible only if they were given substantial freight reductions by Japanese lines, probably to enable them to develop a new market at the present opportune time.

Tests of Fire Retardents, with Special Reference to the Shingle Roof

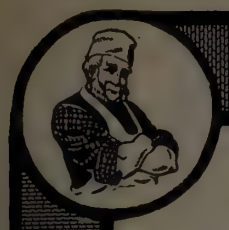
By Herman von Schrenk and Arnold von Schrenk

It has been known for a great many years that wood can be made more or less fire-retardent or fire-resistive. Such wood has, in the past, been called "fireproofed wood," which is an incorrect designation, because no process of treatment has ever made wood absolutely fireproof, and this is no less true of every other class of building material, none of which is absolutely fireproof under all conditions.

During the past year we began a series of investigations, on behalf of the National Lumber Manufacturers' Association, on fire-resistive treatment of wood. It was found that innumerable tests had been made in past years, both in this country and abroad, to demonstrate the efficiency of various compounds. These tests have usually taken the form of completed small buildings, one of which was built of wood in its untreated condition, the other built of wood treated with a fire-resistive compound, and setting fire to both of them. Such tests, while they are more or less spectacular, have very little practical value except in demonstrating that there are certain compounds which will retard ignition, or prevent it entirely. Conclusions of value cannot be drawn from these tests, because they hold only for the particular condition under which the test is made and have given practically no information as to the relative value of different fire-retardent substances, or of their permanence and weather-resisting qualities. In the same category fall other types of tests, made with torches, heated irons, the burning of shavings, etc., etc.

After an exhaustive study of the entire question, it was concluded that the first requisite for the proper interpretation of the possibilities of using fire-retardent wood was to develop some method for testing, first of all, the relative efficiency of fire-retardent substances as applied to wood, particularly as to the fire-retardent qualities of such compounds as distinguished from their permanence, availability, or cost. The second point concerning which very little information of definite value is available was the permanence of fire-resistive wood or the manner in which such wood resisted the action of wind and weather.

It was furthermore soon found that any discussion of the subject fell naturally into two divisions, due to the different methods of use



FOR THE MEN

You can't do any better than to give them good bread made of

and application of fire-resistive wood, one of which naturally deals with the problem as applied to building lumber and the other as applied to shingle roofs. The requirements for a successful fire-retardent will be very different for these two classes of use. A good shingle fire-retardent must be a compound which will be (1) fire-retardent, (2) permanent, that is, that it will remain unchanged on the roof, (3) that it will not be soluble in water, so as not to contaminate water for possible use in cisterns, etc., (4) that it will have a neat and attractive appearance, and (5) that it will be reasonable in cost.

In the case of building lumber, the question of insolubility in water is not of so great importance, and it frequently will also be found that the class of material used, for interior work particularly, will permit processes too expensive for use on shingle roofs. It will thus be seen that any investigation dealing with wood in relation to fire-retardent substances is an extremely complex and far-reaching matter.

The Tests

After a complete analysis of the problem, it appeared to us that the first thing to be done was to obtain definite information of the relative and actual fire-resistive qualities of the principal compounds advocated for rendering wood fire-resistive. It was determined to make the preliminary investigation with a small electric furnace developed by the United States Forest Service, to whom we are indebted for advice and assistance in this connection.

Without going into a detailed description of the apparatus, it may be said that the furnace is one in which treated wood is tested under definite conditions, which are identical for all of the tests made. The tested sections are exposed at the same distance to a plate heated electrically to a constant temperature (in all of the tests so far made the temperature was 450 degs. Centigrade, or 832 degs. Fahrenheit.) The efficiency of the material tested was measured by the length of time which it took, under the conditions described, to bring about ignition.

For these preliminary investigations all of the pieces of wood tested were kiln-dried. The fire-retardents used were bought in the open market or were contributed by the companies manufacturing them. The various compounds were applied to the test pieces as nearly as possible in accordance with the specific directions given by the manufacturer. Immediately preceding the tests, the pieces were carefully weighed, and they were again weighed after the tests. The difference in weight may be taken as a general indication of the relative value of the various compounds after ignition had once taken place. During the progress of the tests careful records were kept of the period of ignition and the duration of the burning of each piece tested. In addition to this, records were kept of the general characteristics, such as the intensity of burning, rate of spread of the flames, etc.

Up to the present time approximately 24 compounds have been tested. Two series of tests have been in progress, one using red cedar shingles and the other using yellow pine panels 6 in. x 12 in. x 5/8 in. thickness. The manner in which the tests were conducted was the same for both series.

The Shingle Roof

The proper construction of a fire-retardent shingle roof involves not only the treatment of the shingles with an actual fire-retardent, but also the problem of using a material which will withstand the action of the weather and which will not contaminate the rain-water. It is obvious that a compound may show very high fire-retardent efficiency, but very poor lasting power on a roof, either because of checking or flaking or by being more or less soluble in water.

In order to get some preliminary information as to the permanence of various compounds advocated for application to shingles, a number of experimental roof sections were constructed, each 6 ft. x 6 ft. These have now been under observation for approximately nine months. Each roof section has a gutter and a downspout leading into a barrel, so that the water coming from each individual section is collected for subsequent examination.

The Problems

It was inevitable that, early in the development of the investigation, we were confronted with an increasing number of problems and with a growing realization of the necessity for widening the scope of the investigations if we were to obtain the practical results contemplated. It should be remembered that the problem of first importance is getting an efficient fire-retardent shingle roof. The application of the fire-retardent must result in reducing the flying-brand hazard, and this must be done at minimum expense. The principal investigations so far conducted have dealt almost wholly with the question of fire-retardent efficiency.

The Needs

While these investigations have thrown much light on the present status of the fire-retardent question, the principal results obtained indicate in the strongest possible manner that it will be absolutely essential to enlarge upon these investigations before they can be practically applied. The present apparatus, while it has given and is giving valuable indications, will in all probability have to be considerably modified. The means at command have not permitted reconstructing this apparatus or undertaking a number of exceedingly important tests to increase its efficiency. The importance of having an approved national standard method for testing fire-retardence is of the utmost importance, because in the event that one or more such fire-retardents prove to be commercially practicable, it will be necessary to control the character of the fire-retardent, so that one may at all times know what class of material is being sold.

The second line of investigations (which should be very considerably extended and enlarged) deals with the construction of more exposed roof sections for testing permanence and possible water contamination. In addition there should be a considerable number of such roof sections available, treated with the same compounds, to be used for actual ignition tests after varying periods of exposure. While the results obtained in the electric furnace are of great significance, it should not be forgotten that after all a severe roof test under thoroughly known conditions will be necessary to draw reasonably accurate conclusions. The roof sections which are under observation at the present time are too few in number, and were erected with the modest means at our command to arrive at a method for making such determination. It is not at all impracticable to have a very considerable number of such roof sections constructed in various parts of the country in order to obtain data as to the influence of various climatic conditions upon the permanence of the material. It has already been shown that, after only nine months, some of the compounds tested are absolutely unfit from an exposure standpoint, although of very high value as fire-retardents.

Other Points

Intimately connected with the problem of rendering roofs fire-resistive is the question of the relative heat conductivity of the wooden shingle when compared with tile, slate and other forms of roof covering. A very small beginning has been made in this direction by the installation of self-registering thermometers in the garret of one building having a wooden shingle roof, a corresponding instrument in a protected place out-of-doors, and a third in a garret of a building covered with a metal roof. While the fire-retarding qualities of the wooden shingle are of the first importance, the allied problem of heat conductivity is so intimately connected with the fire-retarding qualities that the investigation of the two problems should go hand in hand.

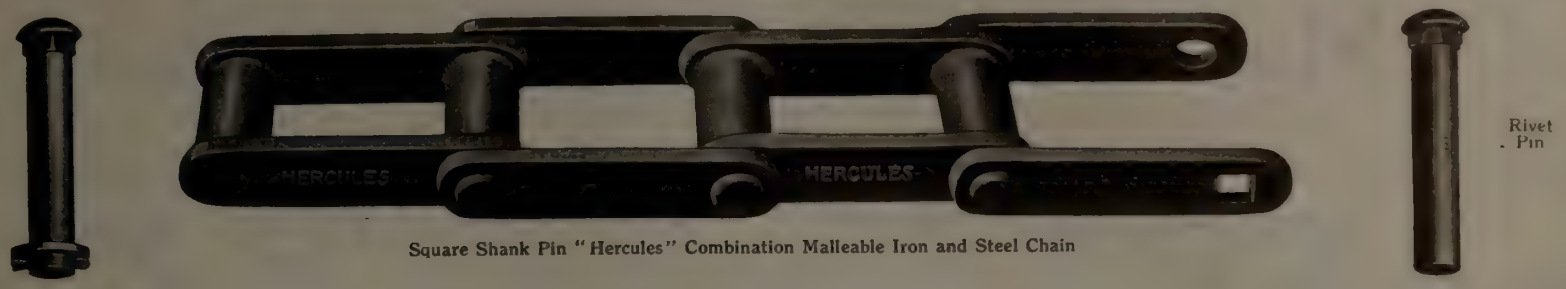
Conclusions

The conclusions so far reached indicate that several compounds are now available which, if properly applied to wooden shingles, will give a shingle roof a very high degree of fire-resistance. These same compounds at the present time have every guarantee of permanence, so far as this can be determined from a chemical investigation. They are insoluble in water and give a roof a pleasing appearance. For interior work, or for such places where direct weathering is of secondary importance, a very considerable number of compounds can be recommended, ranging from good mineral paints to more expensive materials. The strongest emphasis should be placed on the statement already made, that these results must be regarded as purely preliminary and that it will be absolutely essential to carry out some of the plans suggested before definite recommendations can be made as to the widely extended practical application of one or more of the substances investigated.

The results certainly indicate that there is every probability that a number of substances will be not only practicable, but fairly cheap, which with simple directions can be applied by the ordinary house owner and give him a high degree of fire protection, whether on a roof or in a building. The time is here now when advantage should be taken of the facts so far ascertained by enlarging on the scope of the demonstration tests. When such enlarged determinations have been made, there will be no reason why the manufacturers of lumber should not go before the public with a perfectly definite and concrete statement as to what may be reasonably expected of their product when properly safeguarded.

Mr. Harold Kennedy, who was at one time a very prominent lumberman in Quebec city, carrying on an extensive export trade to the Old Country, has acquired an estate near Maidstone, England, which will be placed at the disposal of the Canadian Medical Service as a convalescent hospital. The mansion is a very fine one and the estate comprises 5,000 acres. Mr. Kennedy has already placed Bromley Hotel at the disposal of the Canadian Medical Service for the same purpose.

During the year ending May 1, 1916, the National Hardwood Lumber Association inspectors were called upon to inspect in the Toronto district, 3,384,481 feet of lumber.



Square Shank Pin "Hercules" Combination Malleable Iron and Steel Chain

To Insure Maximum Elevator and Conveyer Service

Under Heavy Duty—In Gritty, Abrasive, Damp or Acid Conditions

Use Jeffery Square Shank Pin "Hercules" Chain

The **SQUARE SHANK PIN CONSTRUCTION** holds the pin absolutely rigid in the outside steel bars—confines the wear to inside of solid links—practically no wear on outside links.

These Chains are the **"GREAT SUBSTITUTE"** for many Detachable Chains working in rough or gritty conditions, and work over many sizes of Standard Sprocket Wheels.

STEEL SIDE BARS are of high carbon steel or manganese steel, and are interchangeable. The Square Holes maintain pitch by preventing the turning of pins.

SAW MILL MACHINERY

Write for copy of Catalog and Price-List No. 160-6, featuring our complete line of Chains, and Attachments, Sprockets, Power Transmission Machinery, Elevators, Conveyors for handling Logs, Lumber, Refuse, etc.

The Jeffery Mfg. Co.

Canadian Branch and Warerooms, MONTREAL

(We carry a stock of Standard Chains, Sprockets, Spiral Conveyor, Gears, Elevator Buckets, Bearings, Hangers, etc.)

THE SOLID LINK is made of either Malleable Iron or Manganese Steel. Its wide Pin and Sprocket Bearing Surfaces take the wear.

Jenckes Boilers

We make a Specialty of

Horizontal Tubular Boilers

for Saw Mill work. They are made in an extensive plant built and equipped for the purpose with all modern appliances.

The three prime elements of Design, Material and Workmanship receive equal and most painstaking attention, ensuring a boiler warranted to give perfect satisfaction and long service.

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

New Lighting System for Lumber Camps

The accompanying illustration shows an interesting equipment for lighting service, which is known as the "Carbic Light." This system of furnishing light in isolated places is especially adaptable for use in connection with lumber camp operations, being of service not only for actual bush operations, but also for the lighting of the lumber camps. The operation of "Carbic Light" is a very simple matter. It produces a powerful, white light, and the equipment requires no attention. It is portable, and is absolutely safe, as well as inexpensive.

The special feature of the Carbic system of lighting is the use of "Carbic cakes," which take the place of ordinary carbide of calcium. The carbic cakes are simply dropped into the machine as required and each of these cakes will produce approximately 15 cubic feet of pure acetylene. By the construction of the generators, the gas is automatically produced as required; that is to say, as soon as the lights are turned out generation ceases, and it is resumed when the lamps are again put in operation. There is, therefore, no waste, nor is there any after-generation, which is such an unpleasant feature in connection with some classes of acetylene lights; none of the characteristic unpleasant smell of carbide is experienced. Each cake will generate up to the last fragment. The operating expense is below that of ordinary coal oil. One filling of "Carbic Cakes" will keep the lamp burning steadily up to 12 hours, giving from 500 to 5,000 candle power as required. This system is possibly the newest, most simple, and most efficient method of producing a volume of perfect light, by which work can be carried on the same as in daylight. Many lumbermen are at present using the Carbic Light System with success. W. L. Foster, 8 Lombard Street, Toronto, is the Canadian agent.

New R. H. Smith Company Officers

The R. H. Smith Co., Ltd., St. Catharines, Ont., saw, knife and tool manufacturers, announce the following new officers: President, Mr. C. J. Shurly, Galt; Vice-President, Mr. R. F. Shurly, Toronto; General Manager and Treasurer, Mr. Fred Shurly, St. Catharines; General Superintendent, Mr. H. W. Byrne, St. Catharines; Secretary, Miss M. M. Parks, St. Catharines.

The President, Mr. C. J. Shurly, has had a long acquaintance with the saw trade, having been for many years senior member of Shurly & Dietrich, Maple Leaf Saw Co., Galt, Ont., from which company he withdrew some six years ago.

Mr. Fred Shurly, General Manager, is also well known to dealers and users of saws throughout Canada, having been associated with his father as representative salesman, as well as having a practical experience of the business.

Mr. H. W. Byrne, General Superintendent, has had a wide experience in the manufacture and use of saws, both in the United States and Canada, fourteen years of which he spent with the lumbering industries in the Ottawa Valley.

The new officers have acquired all the stock and holdings of the R. H. Smith Company, Limited,, have no connection whatever with any other concern and are purely Canadian in their organization. They are now remodelling and equipping their plant with new and improved machinery, which will enable them to maintain the "Leader" quality of goods.

It is interesting to note that the R. H. Smith Company, Limited, is the oldest saw works in the Dominion, having been established in 1855 by Joseph Flint, and has been doing an uninterrupted business for over 61 years. It is also of interest that the Vice-President, Mr. R. F. Shurley, and the General Manager, Mr. Fred Shurly, are grandsons of the founder.

The slogan of the company is "Goods of Quality."

A Hose Reel Adaptable to the Lumber Trade

Adequate fire protection is one of the first and most necessary considerations with every sawmill owner and lumberman, and any new device that will eliminate the danger of fire is always of interest. We illustrate herewith the Montgomery Faultless Hose Reel, which is meeting with great success, and is particularly adaptable for installation in mill buildings. The simplicity of operation of the Faultless Reel at once commends it. One of its strong and exclusive features is that it is instantaneously automatic, and is fool-proof. It can be attached to the wall, or built in, in cabinet form. The reel is so built that the water can be turned on without unwinding the hose, as the staves supporting the hose collapse, allowing of its expansion. Many of the provincial buildings throughout the country have been equipped with the Faultless Hose Reel, which is manufactured by the Montgomery Faultless Hose Reel Co., 47 Gore Vale Avenue, Toronto.

The Hogan lumber yard at Savanne, Ont.. was destroyed by fire on June 10th.

The Blind River Boom and Slide Company, Limited, Blind River, Ont., have secured an extension of their period of existence for a further term of ten years, from May 26, 1916.

The sash and door factory belonging to the Peter McLaren Lumber Company at Brockville, Ont., was seriously damaged by fire recently. The loss was partly covered by insurance.

The by-law to grant exemption of taxes for ten years to the Elmira Planing Mills Company of Elmira, Ont., was carried unanimously. This business was formerly carried on by Bauman and Letson, both of whom are interested in the new company.

Woodsplitter Limited, has been incorporated with head office at Toronto, Ont., and capital stock of $100,000, to carry on business as timber merchants, sawmill proprietors, etc. The provisional directors are R. McCulloch, F. H. Roberts and E. Gillis.

The Baetz Bros. Furniture Company, Limited, will take over and carry on the furniture manufacturing business of Baetz Bros. and Company, of Berlin, Ont. The capital stock of the company is $75,000. C. J. Baetz and J. A. Scellen are the provisional directors.

The Frontier Pulp & Paper Company, Limited, have been incorporated with head office at Thorold, Ont., and capital stock of $50,000, to carry on a general lumber, paper and pulpwood business. Mr. G. W. Knox, Niagara Falls, N. Y., is attorney for the company.

The Kilgour Davenport Company, Limited, have obtained a charter and will manufacture furniture, particularly davenports. The head office of the company is at Toronto, Ont., and the provisional directors are H. P. MacGregor, A .MacGregor and W. Keenan, all of Toronto.

The Wright Furniture Company has been incorporated at Port Arthur, Ont., to carry on the business of manufacturing, buying and selling furniture. The company is capitalized at $40,000, and the provisional directors are W. A. Wright, W. F. Lanworthy and A. J. McComber, of Port Arthur.

A group of Meaford manufacturers are negotiating with the Town Council of Stayner, Ont., for the erection of a planing mill and woodworking plant at that place. The manufacturers propose erecting a building to cost $25,000 and are asking for a loan of $15,000 from the town. If the deal goes through 35 men will be employed the year round.

The National Wood Manufacturing Company, Limited, South River, Ont., have commenced the erection of a large factory and a small sawmill, where they will manufacture veneers, baskets, broom and mop handles and a number of other kinds of small woodenware. The company already have secured such machinery as they require at present. They purpose selling their output wholesale. Among those interested are W. J. Ard, general merchant, C. A. Jackman, Albert Howard and T. J. Ryan, all of South River.

Eastern Canada

G. Lachance & Cie, pulpwood dealers, Chateau Richer, P. Q., have been registered.

La Lac Blanc Cie, have opened a lumber and granite yard at Montreal, P. Q.

J. A. Guertin, Shawinigan Falls, P. Q., sash and door manufacturers, have been registered.

The large woodworking factory belonging to Mr. John Gaudet at Memramcook, N. B., has been destroyed by fire. The loss is estimated at nearly $20,000.

Tuttle's lumber mill at Moncton, N. B., was destroyed by fire on June 11th. The loss amounted to about $8,000. The mill had not been operated for some time. There was no insurance.

A new company to be known as the Sorel Shipbuilding and Coal Company has been formed to engage in shipbuilding and ship repairing. The capital stock of the company will be $100,000, and the head office will be located at Montreal, P. Q.

An amalgamation has been brought about between the Montreal Box Board Company, of Montreal, and the Trent River Paper Company, of Frankford, Ont., makers of straw and wood board. When the details of the amalgamation are complete the firm will be known under the name of the Canada Box Board Company.

The Canadian Forestry Products Limited, has been incorporated with head office at Montreal, P. Q., and capital stock of $9,500, to carry on business as manufacturers of and dealers in timber, wood, timber limits, pulpwood, cord wood, railway ties, etc. Those interested are L. H. Boyd, A. R. Johnson and J. O. O'Brien, of Montreal, and A. Ross, of Westmount.

Western Canada

A. Forsythe & Company, lumbermen, High Bluff, Man., have opened a branch at MacDonald, Man.

Councillor Williams, Sperling, B. C., who recently sold his sawmill to Wm. MacDonald, will start another mill at Salmon River, near Jardine, B.C.

The sash and door factory and stock belonging to J. G. Morton at Vic-

toria, B. C., was recently damaged by fire. The loss is fully covered by insurance.

Wm. Warren Zlyth, of New Zealand, who has extensive investments in British Columbia, proposes to construct and operate a shingle mill near Vancouver, B. C.

The Hammond Cedar Company, Limited, has been incorporated with head office at New Westminster, B. C., and capital stock of $40,000, to carry on business as manufacturers of and dealers in timber, logs, lumber, etc.

Extensive floods in the East Kootenay Valley, B. C., through which the Elk River and its tributaries run, are reported to have destroyed mills belonging to the Riverside Lumber Company, the Ross-Saskatoon Lumber Company and the Elko Lumber Company.

Wm. MacDonald has purchased the Sperling Lumber Company's plant at Sperling, B. C., and is moving it to a new location adjoining a timber limit containing some 6,000,000 feet, largely of spruce. It is expected that the mill will be in operation shortly after the first of July

Sealed tenders are being received by the Minister of Lands for British Columbia, until July 5, 1916, for the purchase of License X649, to cut 3,000,000 feet of spruce, fir, balsam, and jackpine on an area situated on Bugaboo Creek, Kootenay District. One year will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until July 5, 1916, for the purchase of License X549, to cut 2,000,000 feet of spruce, fir, balsam, and jackpine on an area adjoining Lot 9023, Bugaboo Creek, Kootenay District. One year will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until July 5, 1916, for the purchase of License X615, to cut 1,070,000 feet of Douglas fir, cedar and hemlock on an area adjoining Lot 2696, Green Bay, Nelson Island, New Westminster District. Two years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until July 5, 1916, for the purchase of License X617, to cut 3,737,000 feet of fir, cedar, hemlock, and 730 poles on an area adjoining Lot 672, Skookum Chuck Narrows, New Westminster District. Two years will be allowed for the renewal of the timber.

The Fegles-Bellows Engineering Company, Limited, has been incorporated with head office at Winnipeg, Man., and capital stock of $100,000, to carry on the business, among other things, of manufacturers and dealers in lumber and timber, wholesale and retail lumber merchants, to operate sawmills, planing mills, etc. Those interested are D. B. Fegles and W. S. Bellows, of Fort William, Ont., W. H. Carter, F. E. Halls, G. E. Elliott and W. Smith, of Winnipeg, Man.

Messrs. Wilson Bros., a United States firm, who have large holdings of timber on the Nimpkish River, Vancouver Island, have nearly completed negotiations with the B. C. Government for the right to develop 30,000 h.p. on the Nimpkish River. When these negotiations are concluded they will commence the construction of a dam on the river and will put up a large sawmill. It is reported that the company will spend from three million to four million dollars on their various plants.

A New Adam Hall Camp Heater

The accompanying illustration shows a new camp heater which has recently been put on the market by Adam Hall Limited, of Peterboro, Ont. This is a somewhat smaller heater than the former ones produced by Adam Hall Limited, being only 23 inches in diameter, and consequently lower in price. It is made with a solid steel body, cast ends and adjustable shelves, and is a successful addition to the extensive line of lumbermen's stoves and ranges manufactured by this well-known and reliable firm. Adam Hall, Limited, have for years

The New Adam Hall Camp Heater

been exclusive manufacturers of lumbermen's ranges and not only in Canada from coast to coast, but through many other parts of the world their ranges can be found. Accompanying the Canadian Forestry Battalion now operating so successfully in the English forests, went Adam Hall ranges exclusively, with which the whole camp has been equipped.

Jeffrey Mfg. Company Re-open Office at Seattle

The Jeffrey Manufacturing Company, of Columbus, Ohio, announce the re-opening of their Northwestern branch office at Seattle, Wash., and the appointment of Mr. Percy E. Wright, Consulting Mechanical Engineer, as District Manager for Oregon, Washington, Alaska, British Columbia and Alberta. Mr. Wright, who has been in the Northwest since 1910, and whose connection with this company dates back to 1902, has had a wide and varied experience and training in the handling of the Jeffrey line in the engineering, construction, and sales departments, which will enable him to be of great assistance to customers in solving their elevating, conveying and transmission problems.

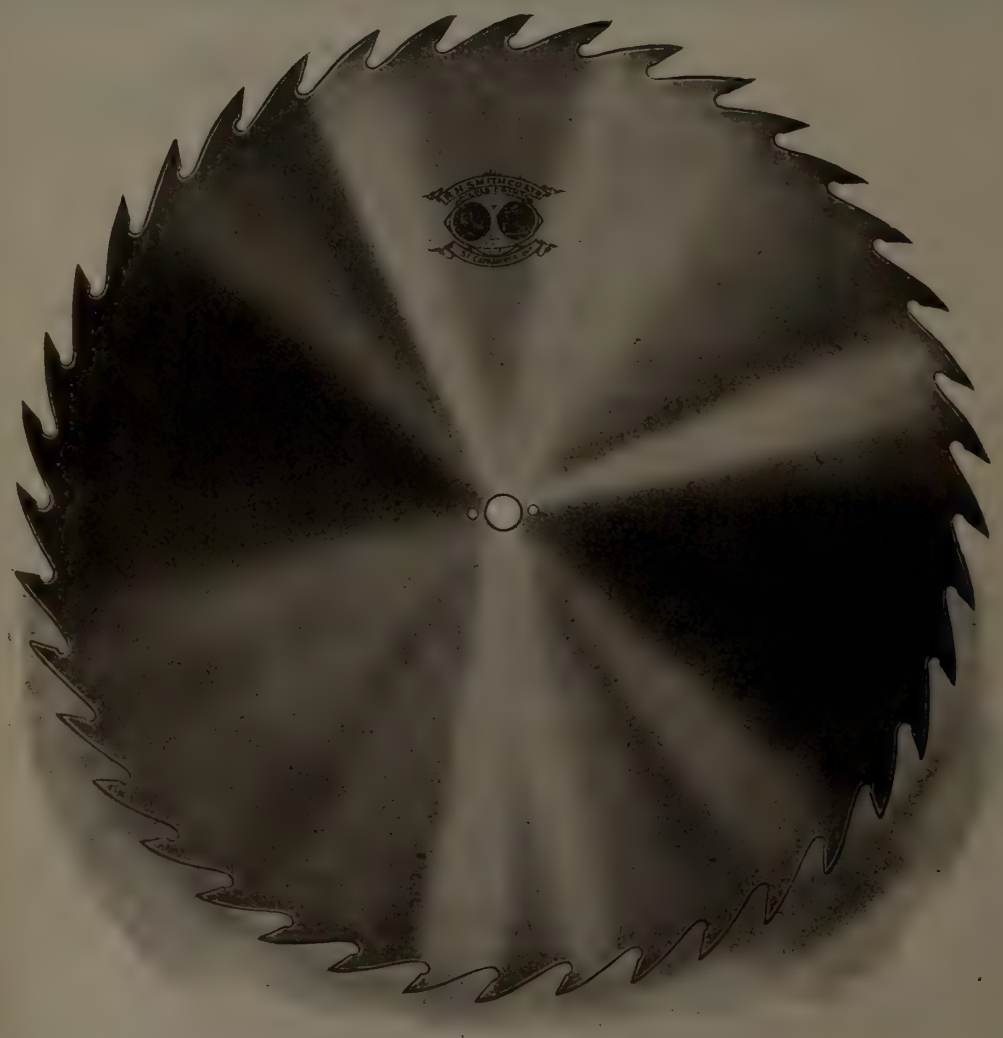
Hoe Chisel Tooth Saws

Mr. H. J. Cooper, sales manager for R. Hoe & Company, 504-520 Grand Street, New York (America's oldest saw manufacturers), has just paid a business visit to Ontario, Quebec and the Maritime Provinces. Mr. Cooper reports an exceptional improvement in lumber manufacturing conditions in these provinces, and states that the future outlook for the lumber industry throughout the whole of the North American Continent is decidedly bright.

Naturally Mr. Cooper is particularly pleased with the increased demand this year for Hoe chisel tooth saws, chisel bits and shanks. Hoe products have been before the buying public now for nearly ninety years, and the fact that their sales this year show a substantial increase is evidence of their exceptional merit.

Through the efforts of Mr. H. J. Mackin, of the Canadian Western Lumber Company, Fraser Mills, B. C., a donation of 30,000 feet of lumber has been made by a few of the larger B. C. mills to the Vancouver Aero Club, for the purpose of building hangars for the use of the B. C. Aviation School which opened at Coquitlam on June 15th.

Philip T. Coolidge, who has been assistant State Forester of New Jersey since January, 1915, has opened an office for timber estimating and forestry work in the Stetson Building, 31 Central Street, Bangor, Me. He will undertake particularly such work as timber estimating and mapping, surveying, management of lumbering operations, supervision of stumpage contracts, and forest planting, having had wide experience which fits him especially for such lines of work.



Our repair department will give you the best of service

R. H. SMITH CO., LTD.

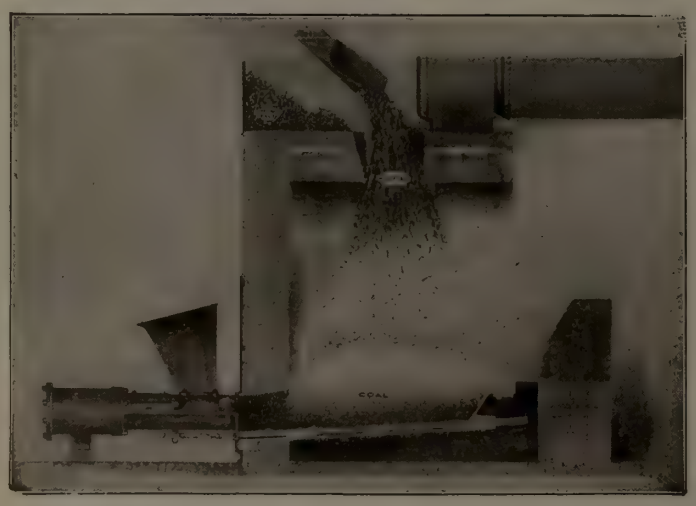
Make Steam and Dollars From Your Refuse



Arrangement of Jones Underfeed Stokers in Dutch Oven for burning paper mill refuse in conjunction with coal.

Burn your saw mill and paper mill refuse in our special Jones Underfeed Stoker Dutch Oven and increase your profits.

Our stokers are installed in many of the most modern pulp and paper mills throughout Canada and the United States using a system combining the burning of mill refuse in conjunction with a small proportion of coal and are giving excellent results. If you have refuse to dispose of or if you depend on coal alone to fire your boilers the addition of a Jones Underfeed Stoker will make an enormous cut in your costs for steam.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa, Deputy Minister.
December 20th, 1912.

Logging Locomotives
Made in Canada

Our fifty years' experience in the design and manufacture of logging locomotives is at your disposal. Many of the largest logging operators in Canada are using our "Canadian Made" locomotives.

Our logging models are as carefully designed and built as our 200 ton sizes—oil or coal burning.

MAY WE SEND YOU SPECIFICATIONS?

This engine is 13½ ins. x 18 ins. and weighs 35 tons.

Packard 3-Ton Chainless Motor Truck operated out of Blind River, Ontario, by Eddy Brothers & Company, Limited.

CHEAPER "TOTING"

Several Canadian lumbermen are effecting a considerable saving by hauling supplies to their camps with

Packard

MOTOR TRUCKS

One Company makes a fifty-mile round trip per day and finds that the cost of operation and road repairs is saved several times by a

Lower cost per ton to deliver goods. Saving of interest and insurance on supplies formerly "toted in" on the snow and carried over for Fall use.

Our truck operation expert will make a trip over your roads and report on the practicability of your using a Packard motor truck, absolutely without obligation to you. If a Packard truck can't "make good" for you, we don't want to sell it. Write us today or

Ask the man who owns one

"Wilson Bros." Hardwood Flooring

is the Flooring that is manufactured expressly to supply the demand for the best. It is made by modern machinery from carefully selected stock, and every precaution is taken throughout our entire system to make it fulfil the requirements in every particular. Write us for prices.

Wilson Bros., Limited - Collingwood, Ont.

The Three Goodhue Belts

"EXTRA" "STANDARD" "ACME WATERPROOF"

These three brands are made for three different services and each brand is the best quality made from selected hides with the stretch taken out.

"Goodhue Belts" stretch less than any other belt by 15 to 25 per cent. This quality effects a great saving because it is unnecessary to be continually shortening the belt to keep it taut.

"Acme Waterproof" brand is made for the wet places in a mill and will give a remarkable service under the most trying conditions.

When you buy a belt—buy a Goodhue. Prices and particulars on request.

LEVIATHAN OR ANACONDA

LEVIATHAN and ANACONDA have been sold on a "make good" basis for over thirty years. If they hadn't made good we would have been out of business long ago. The fact that our business is progressing rapidly is ample proof of the merit of this belting.

With every belt we guarantee full value in service, dollar for dollar, horsepower for horsepower, and just as we have figured our tables of horsepower for the best results, just so in making the above statement, we not only expect to give equal service, but BETTER SERVICE, AND MORE ECONOMICALLY.

A Leviathan Main Drive in constant service for four years at the plant of the Riviere du Loup Pulp Co.—24 in x 6 ply. No cost of up-keep; the belt has never been touched since the day it was installed.

Why not give us a trial order and let LEVIATHAN or ANACONDA prove itself?

BELTING EXPENSE REDUCED 40%

HENRY W. DOUGLAS, PRESIDENT,
L. J. HOOVER, VICE PRES. & GEN'L MGR.

M. J. FRITZ, TREASURER
DANIEL F. ZIMMERMAN, SECRETARY

HOOVER STEEL BALL COMPANY

ANN ARBOR, MICH. 12/30/15.

The Graton & Knight Mfg. Co.,
264 E. Jefferson Ave.,
Detroit, Mich.

Gentlemen:-

We have practically eliminated all other leather belting from our works and are using Spartan Belting entirely on the Dry Grinders, which place we are sure is the most severe use for leather belting there is in the State of Michigan.

We have been experimenting with leather belting for the past three years to get a belt that would give us service. We have not limited ourselves to price on this belt. For this purpose the life of the belt ordinarily is short, therefore, it is our desire to buy the best belting that we can possibly obtain, regardless of price.

Our Engineer has advised us that Spartan Belting has in every way met with our expectation and this has reduced our belt expense approximately 40% within the past fifteen months. Within the past twelve months we have discontinued using all other makes and are using this Spartan Belt entirely as it has been the belt which has stood up for this particular purpose.

Very truly yours,

HOOVER STEEL BALL COMPANY,

LJH:EH Vice Pres. & Gen. Mgr.

Spartan Belting is daily proving its efficiency in plants of every description—saw mills as well as machine tool plants. It is proving this efficiency so conclusively that Spartan is fast becoming the universal equipment for all drives where the physical conditions are quickly ruinous to ordinary belting.

The use of Spartan Belting in your mill will mean the solution of your Hard-drive problems—it will mean greater, more efficient and more economical service. Why not select one or more of your difficult drives and put Spartan to the test?

--Good Files Promote Efficiency

You cannot get away from the fact that when a man is working with a good tool his pride in his work increases. A file worn smooth irritates the most even-tempered workman, while the high-strung, skilled mechanic who works with a bad file for half an hour costs his employer more in wasted mental and physical energy than possibly a dozen files may cost him—in the final results.

Educate your men to throw away their files when they reach their "inefficient point." It is economy. It is efficiency. It promotes good temper at the bench.

FIRE BRICK

On a Quality Basis

Use as much care in its selection as you would in choosing the lumber that goes into your products.

No brick gives the best results for every purpose. The brick you would use for your refuse burner may not give you the best results for your Dutch Oven.

We Manufacture the Following Well Known Brands

"Elkco," "Elk Steel," "St Marys," "Keystone" and "Rotex"

When sending us your inquiries, specify for what purpose you need the brick.

We Make a Specialty of
REFUSE BURNERS, BOILER SETTINGS, KILNS, DUTCH OVENS, ETC.

Catalog sent upon request.

INDUSTRIAL LOCOMOTIVES

A locomotive to justify its cost must start the required load and keep it going.

The right amount of the right material must be provided in the right place.

Each and every part must be sure to fit not only the locomotive for which it was made, but every other locomotive of the same size and design. Spare parts must be instantly available, made so well as to go into place without a machine shop.

We have a number of standard sizes of locomotives in stock and can make immediate delivery.

Machine Knives, Circular Cutters and Mortise Chisel

No. 2 Bolter

Our No. 2 Bolter is constructed in the same careful manner used in all Long Lumber Machinery.

It is of a size designed especially for the single band or circular mill. The No. 2 Bolter carries three 16 inch diameter saws that can be spaced for lath, for pickets or for slat service. The main frame has a one piece construction, covering a floor space of just 4 feet 4 inches x 3 feet 11 inches. Machine complete weighs 1600 pounds

Send for Catalogue No. 102 and prices.

The E. Long Manufacturing Company

Orillia Limited Ontario

Advantages Offered in the Waterous Bandmill

1.—It is built in 8, 9 and 10 ft. sizes—one for every kind of work.

2.—The spring-cushioned, all knife-edged tension device is the most sensitive in use.

3.—Upper and lower guides swing about the exact centre of the saw blade.

4.—The upper guide is raised and lowered by steam, an accurate, easy and swift adjustment unequalled by any other.

5.—Wheel raising device and tilting device are roller bearing.

6.—All operating mechanism is enclosed within the columns—sawdust and slivers cannot reach it.

7.—Massive design of bed and columns precludes vibration during cutting. This mill is absolutely steady doing the heaviest work.

8.—Mandrel bearings, both upper and lower, are easily adjustable and align rapidly and accurately.

9.—Every part of the mill is designed to make millwrighting easy and adjustments and inspections can be made without difficulty.

10.—Waterous Band Mills are designed and built in a plant that has specialized in the manufacture of Canadian sawmill machinery for more than seventy years.

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 30c per lb., Fort William and East; West of Fort William 35c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, 40c per lb.; West of Fort William, 45c, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

"AMPHIBIA"

BELTING

For Difficult Runs

The supreme test—the acid test of belting is on heavy duty machines, over high-speed small pulleys. "AMPHIBIA" Belting on these runs, as shown above, makes you forget belting troubles, because no trouble develops. The wear is there under all conditions.

Prove it. Try a sample of "AMPHIBIA" Planer and see for yourself.

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 8-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Parry Sound Lumber Co., Limited, 26 Ernest Ave. Toronto, Can.

LATH

CHICAGO,

April 25, 1916.

Canada Lumberman & Woodworker,
347 Adelaide St. West,
Toronto.

Gentlemen:

Replying to your valued favor of April 24th, we were very much pleased with the results we obtained through advertising in your Journal recently.

At the time we gave you this ad. we also gave a similar one to two of the other Lumber Journals published in Chicago, and we are frank to state that the only results we obtained came through your publication. As the writer advised your Mr. Simpson, we were obliged to discontinue our ad. with you after running it two or three weeks, as we received sufficient replies to more than take care of our requirements.

Thanking you and with best wishes,

Yours very truly,

CANNON RIVER LUMBER CO.

By E. R. Moore

Almost daily advertisers in the "Wanted and For Sale Department" of this paper tell us the same story as the Cannon River Lumber Co.

Send us that "Want Ad."

QUALITY HARDWOOD

ARKANSAS SOFT PINE
TRADE MARK

Do You Know that White Enamel *Stays* White on Arkansas Soft Pine

because there is no pitch or resinous oil in the wood to discolor the white lead?
Do you realize that because of this fact Arkansas Soft Pine supplies an interior finish suitable for Apartments and fine homes, which you can retail at

Moderate Cost

compared to the scarcer hardwoods heretofore recommended for white enamel treatment?

(Ask for a finished sample)

We want you to know these facts, together with the important information that in connection with the National Advertising of Trade Marked Arkansas Soft Pine, a special book addressed to architects has already prompted requests from two thousand members of that profession for complete information regarding the wood and

Where it can be secured?

Our answer to the last question is:

"At your Dealer's"

Are you the Arkansas Soft Pine dealer in your town?

IF NOT — WHY NOT?

All stock bearing the Arkansas Soft Pine Trade Mark is manufactured and sold exclusively by the following companies:

Cotton Belt Lumber Company, Bearden, Ark.
Crossett Lumber Company, Crossett, Ark.
Eagle Lumber Company, Eagle Mills, Ark.
Edgar Lumber Company, Wesson, Ark.
Freeman-Smith Lumber Company, Millville, Ark.
Fordyce Lumber Company, Fordyce, Ark.

POWER-SPEED-SERVICE WITH DUNLOP "GIBRALTAR" BELTING

YOU CANNOT BEAT "GIBRALTAR"

Now, more than ever, because of the great scarcity of leather, rubber belting is coming to its own.

For this reason—and also because **"Gibraltar"** will give you a hundred times more satisfaction than either Leather or Balata—we urge you to procure a sample of **"Gibraltar Redspecial"** from one of our branches.

They are located in Victoria, Vancouver, Edmonton, Calgary, Saskatoon, Regina, Winnipeg, London, Hamilton, Toronto, Ottawa, Montreal, St. John, Halifax.

When you procure the sample, cut it open, try to pull the plies apart, and note the weight of duck, strength of friction. Then compare **"Gibraltar Redspecial"** with any other make of belting.

"Gibraltar" is constructed of the very best duck. The rubber friction is of the highest quality and has adhesive powers second to none. Separation of plies and stretching are unknown in **"Gibraltar"** Belting. These are some of the reasons why the sales of **"Gibraltar"** have reached their present great proportions.

For Drives, Rotaries, Edgers, Lath and Shingle Machines, or any kind of Transmission work, there is nothing better than Dunlop **"Gibraltar Redspecial"** Belting.

Why not get on the right "Belt Line?"

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, July 15, 1916 No. 14

Utilization of Sawmill Waste

An increasing amount of attention is being given by Governments and by lumber manufacturers to the problem of utilizing sawmill waste. So far as the results of investigations in Canada are concerned, we have little or nothing as yet to go upon, and it is important that the Forest Products Laboratories of Canada should give special attention to this question, so that the large amount of information which they are in a poistion to gather regarding all phases of the lumber producing and consuming industries may be tabulated and made available for practical use. Important results are likely to be obtained from a scientific study of this problem in its various phases and we hope to learn that such a study will soon be undertaken in the thorough manner it merits.

So far as we are aware, the Forest Products Laboratories of Canada have only been able to make a preliminary survey of the field of available information, which consists largely of the statistics prepared by the Forest Products Laboratories of the United States. This information may be used as a basis upon which to work. The fact that all this information is available and that the problem is of such great importance to the lumbering industry should warrant the Canadian Forest Products Laboratories in devoting a large amount of their attention to this study. The problem is one that will never be completely solved, but in which we may hope, almost any day, that scientific research will develop information of great value.

The information which has already been gathered by the Laboratory staff indicates that sawmill waste usually amounts to 35 to 40 per cent. of the whole original tree, being made up about as follows: slabs, trimmings and edgings, 15 to 20 per cent., sawdust about 11 per cent., and bark about 10 per cent. The lumber produced by the sawmill amounts to about 40 per cent. of the whole original tree. Where the quantity of material wasted bulks up so largely in comparison with that which is converted into a merchantable article, the incentive to study possible means of converting a large portion of it into something for which there is a market, is undoubtedly great.

One need only mention a few of the chief methods in which the material that formerly went to waste is now being converted for useful purposes, in order to be convinced of the possibility of making great advances as a result of further study. The most natural way of using up sawmill waste is in the manufacture of small wooden articles by mechanical processes, such as sawing, turning, etc. Much progress has been made in the production of laths, box shooks, small dimension stock, woodenware, novelties, mouldings, pegs, toothpicks, wooden floors, excelsior, etc. The problem in connection with these lines of conversion seems to be very largely one of organization, or in other words, of bringing the sawmill man into closer touch with the consumers who manufacture such small products from wood. Pulp and paper production undoubtedly will consume an ever increasing quantity of sawmill waste. Many other lines might be mentioned.

Probably the greatest advance in the utilization of sawmill waste product is that which has been made in the use of sawdust. Its chief use of course is as fuel. Other uses are as insulating material, bedding for stables, covering for butcher shop floors, polishing material for metals, cleaning material, floor sweeping compounds, artificial wood, moulding, composition board, composition flooring linoleum, special cement, poruos bricks, low grade pulp for fibre board, etc. Shavings also are put to many uses either at the plant or in domestic use as packing material, bedding, material for drying wet land, mixing with concrete, etc.

We have sought only to indicate some of the uses that have already been developed for wood waste. It will be noted that in the majority of these cases the use is dependent to a great extent upon the fact that the material is readily available for the consumer without any considerable added expense in the way of transportation cost. The cost of transportation is one of the chief causes for restraining the economic use of much of the waste material of the sawmill. With increase in poulation, the opportunities for reducing waste will increase. It is, therefore, of much importance to the manufacturers of lumber that the Forest Products Laboratories of Canada should give this problem a large share of their attention. That they are laying plans for doing so and have, in fact, already made a promising beginning, we understand is the case, and we hope that before long they will be able to publish information upon the subject that will be of benefit to the industry.

A School of Salesmanship

In working out ways of combining entertainment and profit through the holding of conventions, our friends across the international boundary unquestionably carry off the palm. Their latest stunt was the holding of a convention known as the S. O. S., or School of Salesmanship, which was brought off successfully at St. Louis, Mo., on June 26th, 27th and 28th, under the auspices of the Southern Pine Association. During these three days, the most prominent and successful salesmen in the association delivered addresses, telling one another how they managed to sell southern pine. Their addresses were remarkable for their variety and for the fund of practical information which they contained. By way of a sample, we have reproduced elsewhere in this issue parts of the address of Mr. M. B. Nelson, General Sales Manager for the Long-Bell Lumber Company, of Kansas City, Mo., whose subject was "Co-operation with Distributors and Consumers."

Mr. Nelson's opening remark is one which may be questioned to some extent. though many lumbermen give it full credit, namely, that there is no other manufactured commodity produced anywhere in the world to which so little thought and study are given to the merits of its use or promotion by the manufacturers and distributors, as is given to lumber. Mr. Nelson was referring particularly to Yellow Pine and we are not in a position to agree with him or criticize his statement, but it is a good statement for our purpose and has a sufficient shafe of truth in it to form the basis of an argument in favor of greater co-operation for the good of the lumber business.

Undoubtedly there is far less of this co-operation than the merits of lumber call for, and Mr. Nelson places the blame chiefly upon the

sales organizations. Getting down to the root of the matter he finds that the average young man who goes into the lumber business with the idea of becoming a salesman, spends a little time at a mill or in a yard or office, and then considers that all he needs in order to become a full-fledged salesman is an order book, some expense money, and sufficient familiarity with the vocabulary of the trade to enable him to talk to the average retailer whom he visits.

We have seen something of this sort of thing in Canada and we know that it is much more prevalent than it should be. The selling of lumber is a task which demands far more than the ordinary intelligence and acquaintance with fundamental facts of the business. It is not now as it was in the good old days when lumber was easy to sell, or rather when it sold itself. The man on the road for lumber today must not only know what his stock is good for, but why it is good and in what ways it is superior to the many lines of substitutes that are fighting for the same buisness.

The first requisite for turning out the best possible class of salesman is to educate him about the product he handles. This should be done far more thoroughly than is customary during the early stages of a young man's business career. The prospective lumber salesman should be given a long enough term in the woods and at the mill to become familiar with the raw material in its natural state and as it comes to the mill. Such an experience will be a fine preventive in after years when he is tempted to cut prices. It will recall to him the fact that the cost of production is not a simple economic term, but a matter of great importance as a basis upon which to commence figuring out prices. He should have enough experience in connection with the retail trade to appreciate the difficulties and problems of the man who buys lumber from the wholesaler and sells it to the consumer. He will then have something to counteract a desire to boost prices in and out of season. He should have a fairly long experience of the office end of the business, so that he will know the value of a business-like reputation for handling orders, and of business-like methods in making reports, to say nothing of a first-hand knowledge of the ideals of his firm.

When a young man has gone through all these experiences he is ready to make a trial of the road. The only things he then requires are experience and a natural gift as a salesman. Thus equipped, he can go forth confidently and will quickly become a force to be taken into consideration in connection with the operations of his firm, but without such experience he is likely to become a liability instead of an asset to his firm, besides being a disturbing element to the trade in the country which he covers.

So far, the equipment we have referred to is that of the man himself, in direct reference to his actual business life. There is coming forward nowadays something which is all important and which will do much to improve the lumber trade, namely, the equipment a man may secure by becoming an active member of an association representing his direct buisness interests. This movement, applied to the salesmen, in the way in which it is applied by the Southern Pine Association, will become a great force for the good of the trade. It will give the salesmen a feeling of mutual interest instead of one of antagonism, and will enable them by exchange of ideas to become far more efficient in their work. Association work has of late years been extending its field greatly and its introduction into the field of the salesman promises great things.

Why Not Get Closer Together?

Retail lumber dealers are developing quite a tendency to co-operate with one another in promoting their mutual trade interests, and are getting encouraging results in practically all cases. One of their ways of improving trade conditions is to watch the producer and the wholesaler and make a note of any cases where stock is sold by them direct to the consumer. When they find someone transgressing in this way they tell one another about him and make things so hot for him that he gets no more trade from these retailers until he mends his ways. No manufacturer or wholesaler who does a legitimate line of business can object to this variety of co-operation. In fact they approve of it and are glad to see that the retailers are alive to their own interests.

While the retailer is keen to protect himself in this way against those from whom he buys, there is a reverse side to the matter which ought to receive a good deal of the retailers' thought. We received, a short time ago, a letter from a successful and progressive retailer in Ontario, who stated that the manufacturers of hemlock ought to make their grading more uniform. "What is the use of buying some thing we cannot sell?" he asks. "Some wholesalers tell us we are getting too particular, but we have to buy what our customers will buy and not what the manufacturer wants to sell to us."

The retailer is the man who should know best of all what lines of stock he can sell to the consumer, and in most cases he is best informed on this point. The problem, to our mind, however, is one of mutual co-operation, with a view to the production and marketing of those lines which the consumer requires and with a view also to enlarging the consumer's ability to use a greater variety of stock.

It is not the manufacturer's fault that, in turning out certain lines of stock which the consumer requires, he also has to turn out other grades which the logs contain; and having turned them out he must sell them, or he cannot stay in the manufacturing business. It is up to the retailer, it seems to us, to make a special point of assisting the manufacturer by continually seeking methods of disposing of a larger share of those lines that are not so saleable as others. Individual cases bearing upon this point vary considerably in their merits. We have no doubt that the retailer who wrote us about this matter is, to a considerable extent, justified in criticizing the manufactuerrs for trying to make him take stock he does not want, by varying the contents of grades. We have a lot of sympathy, however, for the manufacturer who finds that the retailer wants nothing but No. 1 and who, therefore, accumulates a lot of No. 2, which cannot be sold.

We have published elsewhere in this issue the views of a manufacturer of hemlock in Ontario upon this question, and he puts it in a form which shows the necessity for a greater measure of co-operation between the retailer and the wholesaler than has existed in a good many cases in the past. The complaint of the manufacturer is that the retailer will not listen to him when he tries to sell him No. 2 hemlock, and yet when he, the manufacturer, enquires of a retailer's customer he learns frequently that the latter could use this class of stock to good advantage. The manufacturer must get rid of this stock in some way and it is natural that, if the conditions complained of continued, he would have to seek his market more directly than through the retailer who would not assist him.

There is nothing more demoralizing to the whole trade than to have its members trying to cut one another's throats, or even neglecting to assist one another, when a little brotherly interest in the other fellow will show that assistance can be profitably given. The manufacturer who writes us about this matter does not base his argument upon any plea for charity, but proceeds to show how the retailer can dispose of No. 2 hemlock at a profit, if he will only cultivate his market closely.

We have no brief for this manufacturer, nor for any manufacturer, against the retailers, or vice versa, but we have a brief for all of them and wish to see things worked out to their mutual advantage. In the present case it looks to us as though there are faults to be found with both parties, and lack of co-operation between manufacturers and retailers, and between manufacturers and other manufacturers, that furnish an important cause of difficulty. There are no doubt manufacturers who, feeling that the difficulty in selling No. 2 hemlock entitles them to try to put some of it into their No. 1, are making an attempt to do so. There are no doubt, also, retailers who are not making much of an effort to help the manufacturers by educating consumers so that they will take more of the No. 2.

The best way in which to improve matters, we believe, would be to work up organizations of retailers covering certain definite localities, and to draw the manufacturers more closely together and induce them to act more uniformly in regard to the matter of grades. There

has been a hemlock manufacturers' association in Ontario and no doubt they could be brought together again to discuss this matter. We believe also that it would be possible to get a representative gathering of retailers together to talk over this question, among others, and finally both parties might be persuaded to hold a joint meeting of representatives to plan a way of improving the marketing of the output of the hemlock mills. We would like very much to hear from manufacturers and retailers regarding their views on this point.

Labor Shortage Serious in Northern Ontario

Lumber manufacturers in Northern Ontario, and in many other parts of Canada, are experiencing great difficulty in connection with procuring capable labor for their mills and are looking forward anxiously to the logging season which will start early in the fall. There has been a great drain on the supply of labor during the past two years. For several years the quality of labor available has been deteriorating and, since the war, a large proportion of the best men who could formerly be secured for the sawmills and camps have either enlisted or taken employment in other more remunerative occupations.

A mill manager from Northern Ontario, speaking of the situation a few days ago, gave it as his opinion that there will be a great reduction in the output of logs next winter, as the men will simply not be available for the camps. He finds that the class of labor available to-day is far below the normal average of late years in regard to efficiency. Men who are sent up to the woods and the mills by employment agencies are, in many cases, utterly unfit for the work, and in nearly every case are scarcely half as efficient as the woodsmen of a few years ago. This particular mill manager cited a case, not an isolated one either, in which a man of 60 or 70 years of age was sent all the way from Ottawa. Not only was he too old for the work, but he was bent nearly double and had to use a stick to help him walk. This man was expected to work in the woods at the strenuous labor of logging. It was quite impossible that he could even earn a single cent at such work and the sawmill manager had to pay his fare from and to Ottawa without even getting from him enough work to pay for his transportation.

While there is no disposition among the lumber manufacturers to complain about this situation in so far as it is the result of employees enlisting to serve their country either at the front or in the munition factories, it is a situation which should be studied thoroughly by the manufacturers and by the Government in order to minimize the disturbance which it will produce in logging operations next winter. At the present time, with lumber prices showing a tendency to improve, it will be a pity if the labor situation is not handled so as to encourage production next winter, if this can possibly be done. We have had two winters of heavily curtailed production and during the coming winter it would be possible to do more cutting than during the past two, if the men are available.

Whether it will be possible for the Government to effect any improvement is open to question, but the least they can do is to make an effort. These is no question that it is their duty to consider the matter thoroughly and enquire into any available sources of labor supply for such an important industry, so that it may not be crippled at a time when its activity is of so great importance to the welfare of the country, and even to the welfare of the allied armies. The Government is a great employer of labor and it is possible that some of the ways in which it gives employment may not be as advantageous to the country at present as the use of labor would be if applied to the taking out of timber during the next fall and winter. Take the matter of road construction, for instance. We understand that the Government of Ontario are to-day spending a large amount of money in Algonquin Park in the construction of roads, which, so far as we have been informed, may be considered, in such times as the present, as more or less of a luxury. The men who are working on these roads are probably of a class that would be pretty good for the lumber camps, and we believe, if the circumstances are such as they have been represented to us, that the Government ought to release them and direct them towards the northern timber districts.

The recruiting situation is also one which ought to be given a great deal more study in regard to its relation to the supply of labor. Ontario has suffered heavily from the depletion of its skilled labor ranks in order that Canadian battalions may be filled. It seems a great mistake to allow the recruiting to go on in such a haphazard manner as has prevailed up to date. It has resulted in large numbers of men, fine soldiers it is true, but fine laborers also, being taken away from the northern districts of Ontario, while splendid men for military service are being allowed to remain at home, largely because the right kind and proper amount of pressure have not been brought to bear upon them by the Dominion Government. If the Government had taken charge of the recruiting business in the way that most people in Canada think it should have, from the first days of the war, there would have been far less interference with labor, and unquestionably there would have been a larger and more efficient force recruited in Canada. Nothing would please the lumber manufacturing interests in Canada better than to learn that the Government, even at this late date, was taking hold of the recruiting problem and intended to handle it upon businesslike lines.

There has been so great an interference with the supply of labor for Northern Ontario, indeed, that we hear many lumbermen expressing a conviction that the Government would be justified, and in fact, that it will be its duty, to work out a plan during the coming winter for setting interned Germans, Austrians, Bulgarians, and Turks at work in the logging camps. This matter was mooted to some extent last winter, but nothing came of it. We do not put it forward as a recommendation, but as a suggestion, as the necessity for men is certain to be great, and anything the Government can do to assist the lumbering industry will be very welcome.

Selling Lumber in Department Stores

Leading department stores in thirty-eight cities of the United States are now selling Douglas fir lumber. It is the first time that lumber has been sold that way. The innovation is so popular in the East that it has now become necessary to warehouse stocks in most of the principal cities.

The Miniature Lumber Company, of Portland, is the promoter of this new idea in the modern merchandising of lumber and the first installation of a "department store lumber yard" was at the famous Meier & Frank store of that city. The second installation was at the Bon Marche, in Seattle.

Now the idea has spread to Spokane, Boston, New York, Chicago, Philadelphia, Pittsburg, Washington, D.C., Cleveland, Buffalo, Syracuse, Hartford, Conn.; St. Louis, St. Paul, Minneapolis, Sioux City, Cincinnati, Rochester, N.Y.; Troy, Newark, Brooklyn, Des Moines, Providence, Worcester, Mass.; Baltimore, Dayton, Indianapolis, Toledo, Detroit, Reading, and Trenton.

The material furnished in the department store lumber yards is suitable for any ordinary household repairs, but especially adapted to manual training school purposes. Any person having a desire to build a library table, for instance, will not only find the lumber for that purpose quickly available, but also diagrams telling how to construct the table and a material list of just what is required. The amateur builder can make no mistakes.

The same thing applies in case the amateur builder decides to try his handicraft on a cellarette, bird house, arm chair, sewing cabinet, tabouret, bedroom chest-seat, ironing board, baby crib, window box, trellis for tamato vines, shaving stand, fern stand, foot rest, dressing table, wall cabinet, screen, hall tree, magazine rack, telephone stand, porch swing, umbrella stand, sewing stand, serving table, shirt waist box, book shelf, step ladder, desk, clothes rack, smoking stand, phonograph record cabinet, window seat, piano bench, and scores of other similar articles.

No. 2 Hemlock—A Problem in Selling

Retailers Turn it Down—Manufacturers Push it—Co-operation Needed to Enlarge the Market

By Manufacturer

The complaint of a retail lumber dealer which was sent recently to the Editor of the Canada Lumberman regarding the grading of hemlock by manufacturers, brings up a very important question. It is rather fortunate that the complaint has been made at the present time as the matter is one of which it will be a good thing to have a discussion, so as to bring out ideas that will be of benefit to the trade.

During the past two and a half years the manufacturer of hemlock in Ontario has had much difficulty in disposing of his No. 2 hemlock. As a result no doubt, of this difficulty, some of them have offered a merchantable grade and tried many ways of working off at least a small percentage of their unsaleable stock. When a manufacturer tries to discuss the situation with retailers, most of the retailers will not even give him a hearing on the No. 2 hemlock subject. Yet if he makes enquiry of their trade he often finds quite a number who will use No. 2 hemlock and be glad to obtain it at its proper value. It has been noticeable recently that some of the manufacturers have almost decided to sell to contractors or to anyone who can pay for the material. It seems to us that some manufacturers will follow this plan in the near future if the retailers refuse to assist in placing on the the market the product of the mills when it is put up in a proper manner. This situation has been canvassed so thoroughly by manufacturers of late, that some improvement is being brought about and we now find a number of the retail trade have discovered that it is profitable to handle the No. 2 stock, some even working out ways in which to make a good profit out of it.

Here are some of the points in favor of No. 2 hemlock. In the first place hemlock itself is the second best wood for durability that can be obtained in sufficient quantity to be considered as a factor on the Canadian market. White and red pine are first on the list, then comes hemlock, wobbling along, being cuffed from one side of the road to the other, but never stopping, ungainly and rough in appearance, but "there with the goods" and there to stay. Its price is moderate and its lasting qualities stand second among Canadian or United States products, tamarac and cedar not being considered, as they cannot be obtained in sufficient quantities. Its grip of the nail is very firm, holding it in place and everything attached to it. The trade cannot get away from recognizing the good qualities of this wood.

One inch No. 2 hemlock is the most economical wood for sheeting, but a retailer should not sell a customer all the widths that are made or there will be trouble in putting them on a roof. If a retailer stocked just two widths of inch No. 2 hemlock, say 1 x 4 in., and 1 x 6 in., charging $1 per thousand more for the 1 x 6 in., he ought to be able to do a good business. These sizes are the easiest to obtain. The retailer would have no trouble in buying them. 1 x 4 in. is really the best size, as it goes farthest in sheeting a roof. With 1 x 4 in. there is no waste. A space of half an inch or even more can be left between each board. This is necessary in order to obtain the best results from the shingles, as well as from the sheeting. Then 1 x 6 in. could be sold to parties who are prejudiced against the narrow width 1 x 4 in., and they could be charged $1 per thousand feet extra for satisfying their whim. Other yards could stock 1 x 5 in. and 1 x 8 in., staying strictly by these sizes. The prices of the different widths would regulate the consumption. In the 2 in. stock, 2 x 4 in., No. 2 quality, is nearly as useful as No. 1, because it has, in the case of studding, sufficient strength for the job. Often it will not do for rafters, but a percentage of the stock will answer for this purpose also. For instance, wane that would not be allowed in No. 1 grade on account of the appearance would indicate in No. 2 stock that the piece came from the outside of the log and consequently was the tuoghest timber, being stronger than the heart piece with square edges. Then 2 x 6 in. and wider with slight defects can be used for joisting and will often answer the purpose quite as well as No. 1.

Any grade poorer than those referred to could be sold at a price that will find a market for it. Retailers may ask who can sell goods of the above description. If they will put this question to the traveller when he comes around they will be able to get much of the information they require. Co-operation between the retailer and the manufacturer is the one thing that is required in this whole question. We know that the retailer has his troubles and so have we all, but by working more completely in harmony much good can be accomplished and business will be more of a pleasure than it is at present.

An intimation of the way in which the advertising of a definite standard grade of wood product produces results is afforded by the fact that during the week preceding June 22nd, the West Coast Lumbermen's Association received enquiries for "Rite-Grade" red cedar shingles from Russia, China, Japan, and the Society Islands. All enquiries contained the suggestion that markets could be developed with a little practical promotion work on the part of the shingle manufacturers.

Lumber to Benefit When Peace is Declared

Captain Robert Dollar, of San Francisco, in a recent interview published by the West Coast Lumberman, said: "I think the lumber trade is one of the few industries that will immediately be benefited by the declaration of peace. My reason for thinking this is that the excessive freight rates have caused all foreign lumber dealers to buy from hand to mouth, and I am safe in saying that every yard is short of stock. I know of several yards whose stock is less than 10 per cent. of normal, in fact, some are completely sold out. Unfortunately different kinds of wood are being substituted for Douglas fir and it will require considerable effort to regain our lost trade when freights get down to normal. At present they are about 400 per cent. above normal. I think that in a very few months after peace is declared, freights will tumble down to normal or very near it. I know that many ship owners take a different view of it, and think that for two or three years we are to have abnormally high freights. If they are correct then my view of the situation would just be reversed, and the declaration of peace would not help the lumber trade for many months, perhaps years.

"Nevertheless, after much thought on the subject, I cannot change my views, and cannot help but predict better times for an industry that has suffered more than any other in the United States; therefore, no manufactures deserve a change for the ebtter more than the lumbermen.

"Many industries that have sprung up to manufacture munitions of war will come to a sudden stop when the war ends and a multitude of men will be thrown out of employment. How this will affect the general business of the country remains to be seen, as it will take considerable time to readjust themselves to the ordinary manufacture of commercial commodities, and in the meantime their employes will to a great extent be out of employment."

Canadian Mills Favored

The traffic manager of the Pacific Coast Shippers' Association has recently been investigating relative freight rates on lumber from Washington, Oregon and British Columbia mills to eastern points and finds that the mills across the border are enjoying lower carrying charges that are as much as fifteen cents per hundred pounds in some instances, says the Mississippi Valley Lumberman.

The rate from Vancouver, B.C., to Montreal by way of the Canadian roads, is seventy cents on double loads of fir, while the Bellingham mills just this side of the border pay eighty-five cents to the same destination. American shippers have found that by paying the local freight across the border, they can save money by shipping over Canadian lines.

Another case of disadvantage is in the matter of "moisture allowance." The Canadian roads give an allowance of five hundred pounds on every carload of lumber or shingles originating in Canada and destined to eastern Canadian points and many stations in New England. Even though a car travels only a few miles in Canada and then traverses almost the entire width of the United States, the Canadian shipper gets this advantage which the American mills are not allowed.

Still another handicap suffered by the American mills is that the minimum carload on Canadian lumber is from thirty to forty thousand pounds, while the American lines' minimum is from thirty to sixty thousand pounds. Canadian shippers can ship over Canadian lines to Windsor, Ontario, and trans-ship by ferry to Detroit, and deliver lumber at lower rates than are charged American shippers to Detroit on American lines.

With a view to pushing the sales of B. C. lumber, the Knox Bros. Lumber Company recently opened an office at 286 St. James Street, Montreal. They represent the Victoria Lumber and Manufacturing Company, Ltd., of Chemainus, B.C., and report that sales of B. C. lumber, especially of fir, are increasing at a rate beyond expectation. Mr. J. B. Knox is the resident Montreal representative.

How Many Lath to a Thousand Feet?

Toronto, July 4, 1916.

Editor Canada Lumberman:—

Have you any statistics showing the number of pieces of 4 ft. lath, 1½ in. wide, that a mill will turn out in connection with the production of a thousand feet of lumber? Some mills we have visited recently seem not to have sufficient lath producing equipment for handling all their slabs, etc., and others are able to turn all their slabs, etc., into lath. We have figured that we get 600 pieces of lath out of the slabs, etc., from 1,000 ft. of lumber. We would be interested in knowing what some of the other mills get.

Yours very truly,

Ontario Manufacturer.

"Defective" Ammunition Traffic

In the House of Commons, May 13, 1916, Mr. D. D. McKenzie, M.P., charged Sir Sam Hughes with the following transaction:—

"That it appears from official papers laid on the table of this House, that the Minister of Militia, since the beginning of the war, illegally sold and without any power or authority, sold a quantity of small ammunition exceeding 3,000,000 rounds, to J. Wesley Allison, who represented himself as acting for Vickers, Maxim, Ltd., at a price of $20 per thousand rounds. That the quantity first intended to be sold was 5,000,000 rounds, and that over 3,000,000 rounds was actually delivered."

According to the Hansard report, Sir Robert Borden, on the same day, defending the transaction, stated that:—

"The only ammunition sold is Mark VI., two million rounds of which had been condemned as absolutely unserviceable."

It has since developed in the evidence given before the commission of inquiry presided over by Sir Charles Davidson, that this "absolutely unserviceable" ammunition was sold, through the agency of Mr. J. Wesley Allison, to the British Admiralty.

When the Auditor-General in the first instance drew the attention of Sir Thomas White to the transaction by asking for an Order-in-Council after vainly asking for one from the Department of Militia, he made the following statement in the letter to the Minister of Finance:—

"I have reason to believe that the ammunition was resold at an advance of about 25 per cent., and that its destination was not Vickers, Limited. I may be mistaken in this, but Colonel Allison's connection with the transaction does not tend to allay suspicion."

Sir Sam Hughes, following the lead of Sir Robert Borden in defending the transaction, according to the Hansard report, denounced and threatened the Auditor-General in the following terms:—

"But when the Auditor-General undertakes to say what he has said in the document which has been read; when he makes reflection upon a gentleman who has more honor in his little finger than the Auditor-General has in his whole carcass, I want to tell him that I will find some means of reaching the Auditor-General."

In the same Hansard report the Dominion Minister of Militia said:—

"The statement was made that it was not known where the ammunition was going. The correspondence brought down clearly shows that it was ordered by the firm of Vickers-Maxim, one of the most reputable firms in the world, and was shipped to them, and that the money was paid by them to the Bank of Montreal in England. The statement was made that the ammunition was resold. That statement is absolutely untrue. The ammunition was sold to Vickers-Maxim and the address given of one of their officers."

Before the Davidson Commission on May 25, a few days after Sir Sam Hughes' assertion in the House of Commons, Mr. F. Orr Lewis, president of Canadian Vickers, Limited, gave the following evidence:—

"May I state that Canadian Vickers had no interest in the matter, and the English firm of Vickers had no interest in it."

Furthermore, with regard to the charge that the ammunition had been resold at an increase of 25 per cent., Sir Sam Hughes stated in the House of Commons (Hansard report, May 13, 1916):—

"There was no commission paid, offered, or asked for, by anyone in the transaction. That was brought out this morning before the Davidson Commission. We got $20, and that was all that was paid for the ammunition, so that there could not be any commission."

Before the Davidson Commission it has since been brought out that the ammunition was actually sold to the British Admiralty; and on June 13, Auditor-General Fraser produced a cable from the Colonial Secretary stating that the price paid by the Admiralty for the ammunition was $25 per thousand, f.o.b. Canada, plus freight and insurance. The communication was sent and the reply received through H.R.H. the Governor-General.

Thus the evidence of June 13; and the following is from Sir Sam Hughes' statement as printed in Hansard of May 13:—

"This ammunition was first ordered, I say, by the members of the Vickers firm. Finally it was ordered by Col. J. Wesley Allison, who has the honor of being the Vickers representative, and who had, and still has, the honor of having been seelcted by the special representative of the British Government as agent in the United States of America in respect of very large matters of international concern. He is a gentleman who to-day stands high in the estimation of the people of the country, not from fear—"

Protests at this point interrupted the Dominion Minister in the House of Commons. A heavy national and Imperial responsibility is plainly developing upon Sir Charles Davidson, as Commissioner inquiring into the sale of Canadian Government ammunition, "absolutely unserviceable" and "defective," to the British Admiralty.—Ottawa Citizen (Independent Conservative).

Prairie Demand Still Active

Mr. W. R. Lanigan, chief of the C.P.R. freight department, with headquarters at Winnipeg, visited Vancouver recently, and in the course of an interview, said: "Things are running along in a way which no one should object to in the least. Business is brightening all of the time. On the prairies there is a tremendous demand for lumber springing up and that lumber will have to come from British Columbia. The farmers last year made a tremendous fortune from their wheat, and the result is that they want to build better barns and houses. Throughout the country there is a spirit of optimism prevailing. There is really just as much prosperity here as there ever was in the days of the boom. That wasn't real money that we used to hear about then. It was only paper money. Lots changed hands for sums of money which never existed at all. The real amount invested in a lot was very small, while its actual price on paper kept on climbing higher all the time. The real business of the community hasn't been hurt any by the boom. Not a bit of it."

Wood Waste Used for Pulp

The use of a steadily increasing amount of wood waste in the manufacture of pulp is indicated by figures compiled by the United States Forest Service. Although the pulp industry showed a decline in the last year for which complete figures are available (1914), on account of the increasing cost of raw material and general business conditions, more wood waste was used than in any previous year.

Approximately 330,000 cords of waste with a value of $1,400,000, were utilized by 35 of the 200 pulp and paper mills of the United States. It is thought that as the price of cord wood goes up, the amount of wood waste used will become greater.

The Canadian pulp industry, the report says, had a vigorous growth during the last few years and the greater portion of its product is marketed in the United States. An average cost of about $6.50 per cord, as compared with the $10 to $16 per cord which many manufacturers in this country are paying for pulpwood, is the reason given for the growth.

It is pointed out that the development of the supplies of spruce in the national forest of the west and Alaska, together with the abundance of cheap water power, will eventually attract the paper industry to locate in these regions. Suitable pulp timber can be delivered to desirable mill sites for the next twenty to forty years, it is said, at prices of about $2.50 to $4 per cord. It is thought that the low price of material and power will more than offset the higher freight rates on the product to the eastern markets.

James L. Grant, who for many years was engaged in the lumbering business in Goderich, Ont., owning and operating a sawmill, and for the last decade was deputy customs officer, died at his home on July 9th, from an attack of grippe.

The Annual of the Canada Lumberman

It is always a pleasure to commend the enterprise of a contemporary and to note the progress which a fellow journalist or a group of fellow journalists are making in the conduct of a publication. We are prompted to these remarks on turning over the pages of the annual number of the Canada Lumberman and Wood Worker, published by Hugh C. MacLean, Ltd., Toronto, Canada. This is certainly a wonderful issue of this fine Canadian publication. Some idea of its bulk may be obtained from a statement of the fact that it contains 172 pages, in which the reading matter and the advertising are quite fairly divided. It is also due to say that the contents of this number are well worthy of the country which it so ably represents. The articles are as varied as they are valuable, and their views of the lumbering and logging industry in Canada are presented by a master hand in each instance.

Where there is such an embarrassment of riches it is difficult to single out features for special mention, and we will therefore content ourselves with congratulating the editorial staff and the publishers of the Canada Lumberman upon this splendid evidence of progress and prosperity. We extend to them our best wishes for a continuance of the same energy and intelligence which they have at all times manifested in the conduct of this publication and invoke for them a financial support which will be fully commensurate with their just deserts.—St. Louis Lumberman, St. Louis, Mo.

The Fibre Structure of Canadian Woods

A Study of Their Characteristics Under the Microscope, With Special Reference to Paper Making

By H. N. Lee, A. M*

ALTHOUGH many other factors must be considered in the manufacture of paper, one of the principal things desirable to know is the nature of the fiber from which the paper is to be made. By means of careful examination with the microscope it is possible to determine the identity of the plant from which the fiber is obtained, to measure accurately the dimensions of the fiber and in the case of pulp to obtain considerable data concerning the method of manufacture, together with the effect of the treatment on the fiber itself. It is the purpose of this paper to give a brief discussion of the following points: (1) the microscopic structure of wood, with a short description of other plants yielding fiber; (2) a comparison of some of the fibers commonly used; (3) the dimensions of some of the fibers commonly used; (3) the dimensions of fibers in the tops, main trunk, branches and roots of trees; (4) identification of fibers.

From the structural point of view vegetable fibers may be classified as follows:—

(a) Bast fibers from the inner bark of ordinary trees shrubs and smaller plants;

(b) Woody fibers from the stems, branches or roots;

(c) Fibers from the so-called veins of the leaves or from the stems of the palms, sugar-cane, Indian corn and similar plants;

(d) Surface fibers connected with the seeds, stems or leaves, etc., for example, cotton.

Canadian products are largely those of the woody stem, though flax or hemp, belonging to the bast group, may develop products of warmer or even tropical countries,, for example, cotton and the hemps secured from the Agaves. It is our purpose to consider briefly that class of fiber included under the heading of woody fibers from the stem, that is, from the main trunk of trees.

Beginning with the structure of coniferous woods we may take spruce as a typical example. Figure 1 shows the appearance of the separated spruce fibers, or tracheids, as they are technically known. Each tracheid consists of a hollow tube, actually about 3 mm. or 1/8th of an inch long, with closed and more or less pointed ends. If we consider a great number of these fibers placed parallel to each other and tightly connected by means of a cementing substance, we have the condition in which the fibers actually exist in the wood. Taking then, a piece of spruce wood and cutting it at right angles to the axis of the fibers we see (Fig. 2) the appearance of the transverse section of the wood, showing the hollow spaces representing the hollow tubes, or fibers. The figure shows one complete year's growth or annual ring, in which the larger, thinner-walled tracheids are those which were formed during the early part of the season, while the smaller, thicker-walled fibers are those formed during the latter part of the growing season. The dark lines extending in a parallel manner across the figure are the medullary rays, which are composed of much shorter cells, placed with their axes running horizontally in the growing tree. Several resin canals show scattered through the section, appearing as little open spots surrounded by a rim of darker cells, these latter being the elements which actually secrete the resin. Looking at a section cut longitudinally along the plane of the rays we get a view as seen in figure 3. The fibers, of course, extend lengthwise, and since the slice of wood is very thin, the tracheids are mostly seen only in longitudinal section. In some places the face walls of the fiber occur and then little circular marks known as the bordered pits appear. These marks are very characteristic of coniferous fibers. In this view the rays appear as collections of cells, perhaps somewhat resembling a brick wall, running in the direction perpendicular to the tracheids. A resin canal also shows in the lower left hand part of the figure, extending in the direction parallel to the fibers. The thin walls and wide openings of the early formed tracheids show here, as in the previous view, in contrast to the thick walls and narrow openings in the summer fibers. In the longitudinal section cut tagentially, that is, at right angles to the rays (Fig. 4) the fibers are seen extending lengthwise. The dark part of the figure is late wood, the lighter part is early wood, the section having been cut slightly obliquely so as to include both. In this view we also see little bead-like rows of cells which show the appearance of the rays when they are cut at right angles to the horizontal direction in which they run. One can easily see that they do not occupy more than 10 per cent. of the total volume of the wood.

Functions of Fibres

In function the fibers both transport sap up and down and mechanically support the tree as a whole, while the rays serve to conduct the sap horizontally and to store up food substances. In structure and function other coniferous woods are, in a general way, very similar to the spruce, but all the woods of this class differ greatly from those of the broad-leaved class.

The fibers of this latter class of wood on the same scale of magnification as those of the spruce, are seen (Fig. 5) to be much shorter, though in some cases broader than the spruce tracheids. The narrower ones are true fibers, the broader ones being the vessels or pores. In the wood (Fig. 6) the vessels and fibers are arranged in a manner exactly comparable to that in spruce wood. In this figure we see the vessels, the larger openings, scattered more or less evenly throughout, while the fibers fill the space between, except where the rays extend in more or less wavy lines. The fibers, unlike those of the spruce, do not conduct sap, but serve only to support the stem—the function of transportation of sap being lodged entirely in the vessels. The rays perform the same function as in the spruce.

Figure 7, of balsam fir, illustrates how much the fiber from this wood resembles that of spruce, as already seen in figure 1, and should we show illustrations of hemlock, the pines, Douglas fir and other coniferous fibers, they would all appear very much the same, i.e., showing uniform, comparatively long and narrow elements. Figure 8, of birch, illustrates the more heterogeneous nature of the elements from the wood of the broad-leaved trees, such as the poplar (Fig. 5), chestnut, basswood, maple, etc. In all of these woods the fibers reach not more than one-third the length of the elements of the coniferous

woods, and are, of course, still shorter in comparison with the fibers of the cotton and linen types. Moreover, it is only in the fiber from the hardwoods that the short, wide vessels or pores occur.

Variations in Size of Fibres

As well as the great difference in the dimensions of different classes of fibers, as has already been shown, there is much variation in the size of the fibers from the different parts of the plant. Considering only wood we find that the first formed wood, that is, the growth of the first few years, shows very short fibers, as compared with later growth. Thus, in Douglas fir the length of the tracheids in the first annual ring averages not more than 1 mm. or 1/25th of an inch, while in the rings up to fifty years old the length gradually increases to about 5 mm. or 1/5th of an inch, which length occurs with slight variation in the rings over fifty years from the pith. Comparison of figure 1, from an annual ring thirty years from the pith, and figure 7 from older wood, illustrates graphically the variation in fiber length according to age. The tops of trees, therefore, have shorter fibers than the older trunk below. The branches, also, as compared with the main stem in the tree have short fibers, while the roots produce fibers, which are often longer than those of the trunk of the same plant. The elements of the root, however, have much thinner walls, and as a result do not produce as much pulp as the same volume of stem wood. In some trees it is said that the tracheids of the early growth of each annual ring are longer than those of the late growth of the same year. In our measurements in Douglas fir we have found the reverse to be the case, i.e., the later formed tracheids are slightly longer than the early formed ones.

Groundwood and sulphite pulp are by all means the most valuable of paper-making materials produced in Canada. In Canada for 1914 the following figures are given for pulp production.

Wood consumed	1,224,376 cords	
	Cords	Value per cord
Mechanical	644,924	$6.86
Sulphite	367,101	6.76
Sulphate	136,569	4.96
Soda	3,785	7.00
Kinds of wood used:		
Spruce	836,387	6.70
Balsam Fir	314,183	6.58
Hemlock	45,246	5.63
Jack Pine	24,715	5.49
Poplar	3,845	6.81

A little more than one-half of the pulpwood cut was manufactured into pulp in Canada. The total cut was 2,196,884 cords. Of the manufactured pulp 424,833 tons were exported at an average price of $20.87 per ton. The total pulp produced was 934,700 tons.

Methods of Treatment

Groundwood is manufactured by grinding coniferous woods on natural or artificial stone. In this process the fibers are rubbed off and finally appear, as figure 9 shows, in short ragged bundles, as very fine meal, or as more or less single whole tracheids. The larger the proportion of single, whole fibers, the better is the product. In this process the chemical nature of the elements is practically unaffected. In sulphite (Fig. 10) or other chemical pulp, on the other hand, the wood is subjected to cooking under pressure with certain solutions and as a result the fibers become separated, and furthermore, have part of their substance dissolved out. The resulting product consists of much more pure cellulose than is the case in groundwood and the paper made from sulphite is much stronger and more durable. As a result of the cooking process the fibers are often much twisted and flattened, but their more or less pointed ends

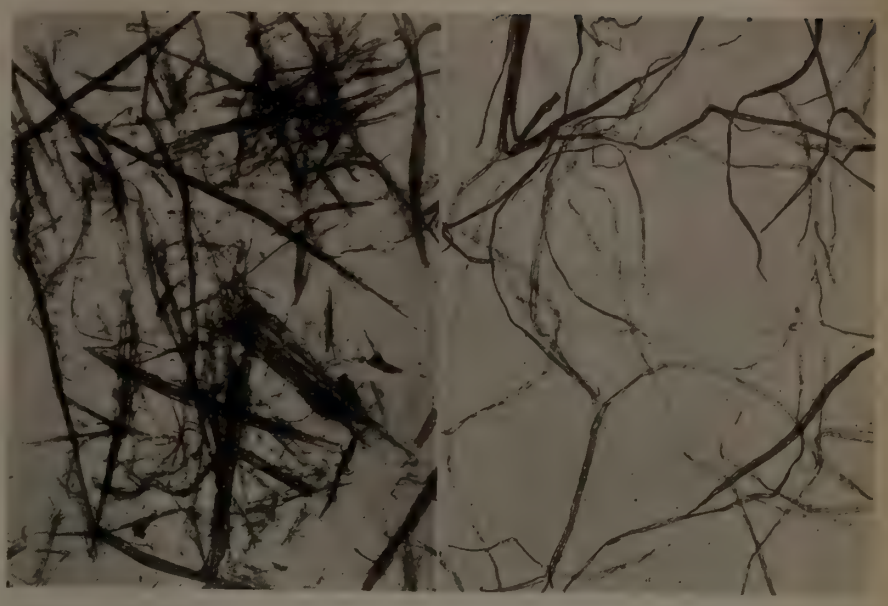

Fig. 9—Ground Wood (Spruce) x 30. Fig. 10—Sulphite Pulp (Spruce) x 25.

and bordered pits in the case of coniferous woods make it easy to distinguish them from other somewhat similar fibers.

For examination the paper is broken up into pulp by boiling with a weak solution of caustic soda, is then thoroughly washed and the fibers carefully separated out on a glass slide with needles. Before treating with the re-agent it is desirable to remove as much water from the fibers as is possible, and in estimating it is best to examine several mounts to get an average. The reagent most easily used is chlorzinciodide. The colorations produced by the more important paper-making fibers are shown in figure 11.

It is sometimes desirable to distinguish positively between the wood of spruce and that of balsam fir. A simple method is as follows: wet the piece of wood and cut a transverse section, not too thin, with a sharp pocket knife. Hold this up to the light and examine, preferably with a magnifying glass, giving a few diameters enlargement. If the wood is spruce, resin canals will show as little darker spots. In figure 2 they are seen as somewhat circular open spaces surrounded by darker rims—it is the darker rims that give the shaded appearance seen in the slices cut with an ordinary knife, as described above. In balsam fir there is no such appearance as this, so the wood may be positively distinguished. After a little practice one will have little difficulty in telling the difference between these two woods, especially if the color, weight and grain are taken into consideration.

How to Distinguish Wood Fibres

Single fibers from coniferous trees may be distinguished from those of the broad-leaved trees by means of the marks made by the openings through which the sap passes from tracheid to tracheid—these marks being the bordered pits already referred to. Moreover, the fibers of the conifers are, in general, much longer, and have more blunt points and the vessels which are seen in the pulp from the hardwoods never appear in the conifers. (Compare Figs. 5 and 7).

Among the coniferous fibers themselves it is somewhat more difficult to distinguish the fibers of different woods, though this is possible in many cases. The variations in size, particularly in length, afford a means of detecting some, but in the case of the more commonly used fibers the general shape is much the same. However, where the tracheids come in contact with the ray cells certain open-

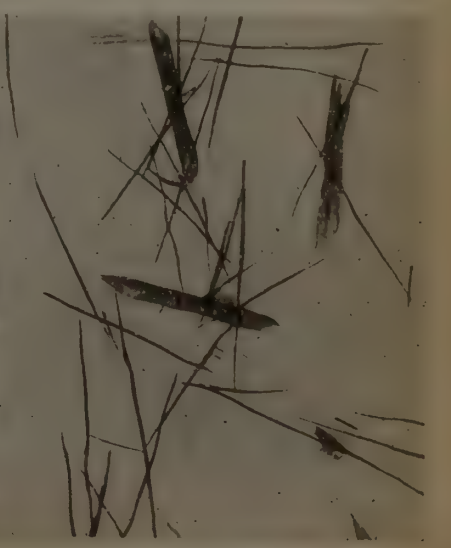

Fig. 8—Birch Fibre x 20.

ings occur which vary to a greater or less extent in the various woods and these openings, appearing as differently shaped marks in the case of fibers from different kinds of wood, afford a means of separating such fibers as those from pine, spruce, balsam fir, Douglas fir, etc. In an analagous manner the fibrous products of the various broad-leaved trees may be distinguished from one another, but such identifications can only be made after a careful examination by an expert.

Co-operation With Distributors and Consumers

By M. B. Nelson*

There is no other manufactured commodity, I believe, produced anywhere in the world to which as little thought and study is given to the merits of its uses or promotion by the manufacturers and distributors as is given to lumber. What does the average lumberman engaged in the manufacture or sale of lumber know about its merits? The measure of success in any line of business or industry is the knowledge applied by those interested. A comparison of what the average lumberman actually knows about the merits of lumber with the knowledge of those interested in most any other line of business, and a comparison of the energy that is expended by the lumbermen in promoting an increase in the consumption of lumber products, is all that is necessary to consider to realize our deficiencies.

I consider the sales organization more to blame than any other department of the business. (The average young man who starts out to learn the lumber business spends a short period at the mills, in the retail yard or in a lumber office somewhere; familiarizes himself with lumber terms and grades and the rates of freight so he can quote on whatever item of stock is listed on the price sheet without making too many mistakes, and, when this has been accomplished, feels that he has graduated and all that is then needed to make him a full-fledged lumber salesman is expense money, an order book, and a vocabulary that enables him to make convincing argument out of information picked up from the retailers about the low prices which are being made by his competitors. Apparently no thought is ever given to doing something that will increase the use of lumber in his territory. The average sales office measures the worth of a salesman by the number of orders he sends in. Some few measure his worth by the value of his orders as compared with the general run of business they receive.

Have Turned to the Education of Their Salesmen

In the most successful industries which have, within a quarter of a century, introduced and created a demand for their products, not only in the United States, but throughout the entire world, they have educated their salesmen as to the merits of what they have for sale, and have spent a great deal of time and money becoming familiar with the arguments in opposition to the use of their products and securing arguments to combat or overcome such opposition. This has been most effectually accomplished through systematic organization where the manufacture has been by one interest or where but a small number have been interested.

I think the reason the lumbermen have neglected this very important feature is the large number interested in the manufacture and distribution of the product, and, further, the fact that the benefits resulting from any energy expended in creating a new demand or combating the inroads of substitutes accrue to the industry as a whole and in but a slight degree to the individual. It is but human to expend energy only where the greatest individual results can be accomplished. Lack of the proper organization all the way down the line is another and probably the greatest cause of our neglect.

First, let us educate ourselves as to the true merits of our product in its different uses, and as to the uses wherein it is equal to or superior to any other known material, by informing ourselves in so far as possible through the limited store of literature; let us find out how long sapwood will last when exposed to the element that causes decay; what known treatments will prevent decay, and what the cost of the same is; how long heart wood will last when exposed to the elements; let us investigate at every opportunity the practices of and methods pursued by the retailers, distributors and consumers of our product in every section, and if their policies are along lines which will not promote the general interest of the lumber business take the matter up with the retailers, buyers or distributors and make sure they understand that they are doing our industry an injustice.

Disseminating Information to the Retailer and Others

After we have gained a better knowledge ourselves of lumber with respect to its real merits and uses, let us take advantage of every opportunity to disseminate information to the retail distributor, engineer, architect and consumer by constant, systematic effort until we have educated everybody who has anything to do with the handling of wood to a point where they will be able to defend its merits and prevent the unscrupulous substitutes from entering our ranks and defrauding the public to the detriment of our business. I do not mean by this that we shall not give due consideration to the merit of any substitute, or that we should recommend the use of lumber where we know it is not equal to something else, because, I figure, such practice would result to our detriment. Our programme must be based upon merit, otherwise our efforts will eventually fail.

Up to this time only a limited supply of educational information is available with regard to the merits of our product, and it is therefore very important that effort be made by all of us to secure further necessary information as rapidly as possible.

Let the salesmen in the different sections of the country organize in small groups and meet as often as convenient, and devise means whereby the retailer, architect, engineer and large consumers of lumber can be properly informed. This can be accomplished by the salesman devoting his spare time with his customer in discussing the subject, in suggesting to the retailer the many uses which could be made of a particular line of lumber in his territory if the proper effort were put forth by him, and that his business would grow as a result. Not only that, but go out with him to the prospective consumer and see that the proper arguments are presented. If he encounters any questions or problems which he cannot answer satisfactorily, let him report the facts to his general office.

Organize with Architect, Engineers and Builders

In the cities and large towns where the consumption of lumber is governed largely by the architect, engineer or builder, I would suggest that the salesmen organize with the retail dealers and call a general meeting of all architects, large contractors, engineers and builders in that particular section; invite them to dinner some Saturday evening, and arrange for a speaker to address them. And be sure the speaker is requested to give strong emphasis to those points which are considered most important to be driven home. Get acquainted with the master mechanic or master car builder in charge of any car shops in your territory, investigate, and make sure that they know all you do about lumber in so far as it affects their line of work. Keep in touch with every kind of construction contemplated in your territory; go to the architect, engineer, or builder with your customer and try to get as much lumber used in the construction work throughout the building as the merits of the wood will justify. You will find that if the architects and engineers are properly approached, they will be more than willing to give consideration to most anything you have to present. It goes without saying, however, that all technical men of this nature are very difficult of approach and are more or less prejudiced in their views, and unless the proper diplomacy is used your efforts will not meet with success.

Every salesman should be familiar with the building code of every city in his territory, and if there is anything in the code that is detrimental to the interest of lumbermen, the salesmen located in that section should get together and organize for the purpose of seeing that the discrimination is corrected at once. We are losing out in many territories to substitutes because these promoters are organized and working along more intelligent lines, not only taking advantage of but creating the opportunities. The consumption of our lumber is decreasing through the development of the substitutes, many of which have not the merit claimed. Keep close watch on every substitute being used for wood and wherever they fail be sure you are on the job and secure the information and report it through your general office so that it can be passed on and distributed. Have photographs made wherever it is possible.

Avoid Waste of Time

How much of the average salesman's time is wasted? I mean by this, how much of his time is expended in a direction which does not result in profit to him, his company, his trade, or to the lumber industry in general? Think how much of this would be converted into an asset if he should take advantage of all the opportunities which present themselves—no day would be long enough. Let us endeavor to utilize our time and energy in creating something. In the selling of lumber we have travelled along the same old road our great-grandfathers blazed for us, with the result that our live, up-to-date competitors have introduced substitutes. They had to do something to introduce their product, they had to create a demand for it, and it has made them more resourceful in this direction, and they are crowding us off the map, so to speak. They all know what their product is good for and what it will do under all conditions—we don't. Some one of the substitutes knocks lumber, saying it is not fit for anything, and we cannot refute the statement because we have never made a study of the merits of our product—we let it go, and they take our buisness away from us.

We have left our selling interests almost entirely to the retail merchant. The average retailer is not interested in timber any more than in anything else. He is interested, however, in selling any product which will net him the greatest profit. Many of the lumbermen are selling substitutes to take the place of lumber when lumber would answer the purpose to better advantage. We cannot blame the retailer—he is working for himself; if he can get more profit out of the substitute he is going to do it. The representatives of the manufacturers—the travelliug salesman—are the proper ones to see that

* Extracts from an address delivered before the School of Salesmanship.

lumber is sold to the best advantage, even though it becomes necessary for us to assist the retailer in selling our lumber at our own expense; we cannot expect them to work for us unless we make it an object for them to do so. The lack of co-operation among competitive salesmen, and as between the salesmen and the retailers, in an effort to promote the general interest of the lumber business is hurting us badly. I believe in co-operation in all things. I compare in my own mind, the struggle of the lumber industry up the hill of success to a loaded wagon being drawn by a string of mules. If we all pull together it will be much easier to reach the summit than if a few pull at a time while the others lay back. Systematic organization is just as essential to the success of our business as to success in battle or in conducting the peaceful affairs of nations.

How the Public Got the Wrong Idea About Associations

Co-operation produces power. This power can be used to build up or to destroy individually or collectively. Some associations misused the power they created, and, as a result, the public, not being familiar with the workings of all the associations, came to the conclusion that many or all of them were detrimental to the general pubic interest. But within the last year or two sentiment has been fast changing. The public is finding out that not all associations in industries are used to its detriment, but that when conducted sanely they are of great benefit not only to the individual interested in the industry but to the people as a whole. We are not created equal in ability in any direction. There are people in all lines of business who are not capable of conducting their own business successfully. They are constantly destroying what someone else produced, and, hence, their operations are detrimental to the general interest, and business failures are the final outcome. A business failure has the same effect as the death of an individual in a community. If the individual was a benefit to the world, then the world sustains a loss by reason of his death. Failure in business is not a benefit to the people as a whole because those interested in the industry are not the only ones who suffer as a result—the general public comes in for its share. Civilization is built on co-operation.

Through our trade organizations it is possible to gather in and disseminate knowledge and information regarding our business which could not be secured and distributed otherwise, and put into effect many economical methods, thus benefiting the people as a whole.

Through Associations Business Failures Can be Reduced

While through co-operation we cannot make all people equal, we can make them stronger, and prevent many business failures. Think what an ideal country we would have if there were no business failures. Through association work we can reduce business failures to a minimum. In some industries, I understand that their associations go so far as to advance money to their members to assist them in tiding over critical periods. The Federal Trades Commission have strongly urged that individual concerns interested in the same industry co-operate toward their own up-building. If we work intelligently for the benefit of the people we will profit by it, but if we work to their detriment eventually we will suffer for it.

The salesmen have a greater opportunity to advance this movement than anyone else because they are constantly calling on the trade, the buyer and consumer. All of us are failing to a greater or less extent to make use of the knowledge we possess, many of us because we are not directly interested at the time. We overlook many opportunities to promote the general interest of the lumber business, whereas if all of us would look at it from a broader viewpoint we would profit by it. For instance, we all know that the creosote treatment has been successful for a number of years, yet the owners and manufacturers of timber are doing but little toward introducing the treated material, seemingly waiting for the people to find out what it is and then call for it. And, as a rule, they are standing ready with a wet blanket, so to speak, to smother any ambitious user who comes to them with a little difficult speculation. Until recently but little or no effort was made by the lumbermen through association to promote in any way the use of creosoted material, but some effort is being made along this line, though nothing to compare with what it should be.

I do not believe the industry as a whole has considered as seriously as it should the giving to the consumer his money's worth. We have given too much consideration to getting all we could for our lumber without giving enough consideration to the consumer. Now that we find that we are failing to accomplish what we have been striving for through the policies we have been pursuing, let us try giving the consumer as much for his money as it is possible for us to do. We cannot do this so long as we are ignorant of what our lumber is good for, and we cannot expect the retailer, or any body else who is not interested in our stumpage, to figure this out for us.

A considerable amount of damage has already been caused this year in the vicinity of Prince George, B. C., by forest fires. Fire has also been reported in the vicinity of Mount Robson. Recent rains, however, have improved the situation greatly.

From the Canada Lumberman of Thirty-five Years Ago

Lumber Trade Booming:—Messrs. McAllister & McLean have sold their Pettawawa limits to James McLean & Co. The figure received, we believe, was something over $130,000, a very handsome and no doubt satisfactory one to the sellers, who purchased the same limits something over a year ago for only $40,000. This sale demonstrates better than anything we have yet heard how the lumber trade is "booming."—Pembroke Observer.

A New and Valuable Invention:—Mr. Finlay Ross, of Byng Inlet, has invented and patented a gang of circular saws, which will probably supersede the ordinary stock gangs of upright saws. Mr. Ross can, by a simple contrivance, arrange on one mandril any required number of saws, which may be taken off at pleasure, as easily as the ordinary gang, by shifting a key and coupling, placed near a pulley at each end of the mandril. The inventor claims that his gang of circulars will cut a much larger quantity of lumber than the usual gang, and that the face will be smoother. Another advantage claimed by Mr. Ross is, that as the saws are arranged so as to run with the grain of the timber they will cut easier and make smoother work than the ordinary circular saw revolving against the grain of a log. The logs are fed with press rollers in the ordinary way. There seems to be a mine of wealth in this simple invention, when fairly introduced.

Muskoka Improvement Company:—A company has recently been organized amongst the lumbermen of Muskoka and Georgian Bay, for the purpose of regulating the driving and sorting of saw logs, constructing slides, booms, piers, dams, etc., on the Muskoka rivers, the Severn, Musquash, etc. At a meeting which was held at Gravenhurst, the company was formed, and $50,000 capital subscribed. Messrs. H. H. Cook, Richard Power, A. P. Cockburn, M.P.; G. W. Taylor, and Hon. Alexander Mackenzie were elected directors. The directors at a subsequent meeting, after electing Hon. Alex. Mackenzie president, prepared estimates of the proposed works and made arrangements for immediately commencing work upon the most urgent of these. A similar company, namely "The Upper Ottawa Improvement Co.," has been in existence for some years, with a capital of $150,000. The directors are Messrs. Bronson, Perley, Eddy, Gordon and H. Hobinson; H. Robinson, president; J. R. Booth, secretary; G. B. Green, acting secretary. The operations of this company extend from the Des Joachim to the foot of Hull Slide. The organization has been found of great service to all parties engaging in lumbering on the Ottawa. The Muskoka Company will doubtless prove equally serviceable.

Lacing Belts on the Pulleys

The modern way to adjust a belt is to do it "right on the pulleys." It's the quickest way, the safest way, the most economical way; that's why it is the modern way.

About twenty years ago it was thought that belts and pulleys had reached their maximum of efficiency. We thought that there was no more to know—leather was "king" of belt materials, rawhide lacing was IT, almost "any old pulley" would do the trick, better bearings were undreamed of, unheard of, and so forth.

To-day there are many belt men who will therefore look upon the "modern" method of adjusting belts with contempt. They will say, "It's a useless extravagance," without looking into the matter thoroughly. For, just as we did twenty years ago, belt men to-day are prone to think that we have reached the maximum of efficiency and that there is "nothing new under the sun."

Well, lacing a belt while on the pulley is a new stunt, and it's a good one. It has every argument in its favor.

To do this lacing properly requires a machine—a couple of clamps, one on each belt end—and a rack arrangement for cranking the two ends together right where you want them. The machine holds the two ends in correct position for lacing and leaves your hands free to do the work most efficiently.

Even where the belt is to run fairly slack, or easy, it is plain that a device like this will prove beneficial. It takes the belt's measure, helps do the work, and leaves the belt right where you want it—all at once.—N. G. Near.

Recent reports from Vancouver state that all the loggers on the Pacific Coast, north of the Columbia River, may close down for a period of 30 days beginning some time next week. The reason given is that the log market is rapidly becoming flooded with a surplus, owing to the rush that took place when the business outlook appeared good. Another cause is the scarcity of labor and the high wages that prevail.

Grading B. C. Lumber for Export

In view of the probability of a strong demand arising for British Columbia forest products in overseas markets following the close of the war, the Hon. W. R. Ross, Minister of Lands, and officials of the Forest Branch, have been devoting a lot of attention to various factors likely to have some influence in determining the volume of business to be done. It is known that the matter of grading has been given considerable attention, and according to the opinion of men in our midst who are familiar with the British timber industry, and who understand thoroughly the methods followed in that important market, it is essential that our export lumbermen should grasp the fact that while it probably will not prove difficult to secure an initial order, the desirable thing is to hold the trade by giving the customer absolutely satisfactory grades, keeping in mind that the market he is endeavoring to serve is open to the world and takes only the best of everything.

The advisability of the B. C. Government establishing its own Inspection Bureau, appointing its own graders, and giving to our lumber the full prestige of the province which produces it, are also matters which have engaged the attention of Hon. W. R. Ross and colleagues. It scarcely is in keeping with the dignity and growing importance of an industry in which the government is a partner to continue indefinitely to do business under the aegis of a foreign corporation, no matter how satisfactory the relationship has been up to the present. Under B. C. inspection and marking there would be little danger of our forest products losing their identity, as has occurred in the past, and every shipment would help put our province on the map of the lumber markets of the world.

Some time ago the editor of the Canada Lumberman asked a well-known manufacturer and exporter for an expression of his views on the subject of grading for the English market, inspection, etc. His letter appears below:

"To explain the grading situation in British Columbia would entail a long discussion and be subject to many conditions which could only be decided by a committee of regular graders. The essential requirement in grading lumber is knowing the purpose for which the lumber is required.

"We understand you would like our opinion as how best to compete with Washington export mills in grading, etc. In the first place, it is necessary to consider the fir timber stands in British Columbia as compared with Washington. Generally speaking the land on which the timber grows in British Columbia is more broken and rocky than in Washington, therefore our percentage of clear lumber is lower, but our percentage of merchantable (barring black knotted timber) is about the same, and our percentage of common, where the land is logged clean, is higher. In other words, the Washington mills have better clears as a rule and more of them, while in British Columbia we have better grades of merchantable export timbers suitable for construction purposes, as it does not pay us to go after the clears so hard on sawing rougher logs. This is preliminary to our remarks on grading.

"In the English market, as before stated, lumber is re-graded for everything there is in it, and purchased with this object in view. If an English buyer can buy clears on a specification of 3 in. and up by 7 in. and up, with average length of say 26 feet, and knows that he will get a uniform parcel of soft fir, he will pay more than if it is all red or hard fir, as it will be used for totally different purposes. And again, if it is just a mixed bunch of clears he gets that is strictly within the grade of clears on one face and two edges, according to the specific Inspection Bureau grade, he will be forced to pay the bill, but will confine his future purchases to mills which supply the lumber on which he can make the most money.

"A great deal of the lumber sold here under such specifications would be suitable in smaller sizes, as it is nearly all used for re-manufacture, some of it even turned into spindles for the cotton trade. Thus the English lumber importer gets the alvantage of us on re-grade.

In Washington the percentage of soft fir, or fir of medium hardness, is high compared with British Columbia, and we should grade out lumber with the express object of competing with a trade they have established. Nearly all of our exported lumber is re-manufactured and we should get the advantage of a reliable grade instead of taking pot luck in mixing red fir, hard, coarse grained stock grown on rough ground or exposed position, and good clears which are uniform and suitable for re-manufacture without undue waste. Each should be marketed separately.

"The Pacific Inspection Bureau does not take the trouble to grade this way, but the individual mill or exporter on the other side is alive to the problem of putting uniform stock into export cargoes or parcels, and cuts a camp run of logs of the same stand of timber, insuring uniformity, while in British Columbia most of the mills buy their logs in booms from different camps. The mills on the Sound are using the public lumber dock in Seattle to advantage, but most of the mills there are not as dependent on it, as they have, as a rule, large piling ground and wharfage of their own. In British Columbia most of the lumber companies' piling ground or wharfage is very limited, owing to the policy of the railway companies, when opening up the country, in getting control of the waterfront by laying their tracks on the foreshore or close to it. The mills have generally fair frontage but no depth. This lends itself to loading scows cheaply and would work to the advantage of a storage dock.

"The certificates of the Pacific Inspection Bureau are used chiefly for financial purposes, so that advances can be given against consignments by banks and lumber brokers, and provided the lumber will stand up to the strict letter of the grade as regards commons, merchantable and clears, the rest is up to the reputation of the shipping mill. British Columbia mills, as a rule, are not equipped for export business, and unless some encouragement is offered them, such as assembling what stock they have suitable for export, they will continue to market their stock in the manner in which they can get real money the quickest. It costs, it is estimated, about 17 per cent. per annum to carry lumber in Vancouver after it is cut, so that the mill is forced to sell quickly or the profit is gone. This shows how important a storage dock is, where uniform shipments can be assembled.

"Salesmanship is also essential, and as in many cases shorts of 12 to 20 feet would be just as suitable for the market as lumber sold on specifications of an average length of 30 feet. One thing that has tended to make export frieght rates high is the long average lengths in the specifications, which takes up space and makes stowing tedious and expensive. The want of shorts and short stowage has prejudiced ship owners and captains against lumber.

"In conclusion, we think the present Pacific Inspection Bureau answers its purpose and is established, but the British Columbia Government might lend a hand in supervising or franking shipments from a storage dock or mills having their own wharf, in seeing that shipments are as invoiced or described and suitable for the market to which they are sent."

Requisites of the Successful Lumber Salesmen of Today

By Alfred Klass, Oconto, Wis.

The secret of nearly every business success is a perfect organization.

A salesman may have good ideas, understand the product he is selling, and have the force to get the business, but make a failure because of a poor organization back of him.

A concern of any magnitude needs more than the general in command to keep it on the road to success. A perfect organization means a place for every one and every one in his place, and the general manager who knows how to pick his lieutenants is the one who has a successful business.

The sales manager and the traveling salesmen are lieutenants and the better they are the more successful that branch of the business will be.

It has been said that a good salesman is one who can sell a man something he does not want and yet satisfy the customer. This may be true; but the salesman who does it is one who knows his product well and for that reason is able to prove to his customer that he really wants what he is not asking for. In this connection I might cite an experience I had when I was handling the retail end of the business. A customer called and asked me for a certain amount of 2 x 6-16. It so happened that we were short of this item and I mentioned it to the customer, whereupon he said, "Well, I can use 12-foot just as well, because I am going to cut them to 4-foot lengths and use them in a sidewalk around the house." Now it was easy in that case to sell the man something he did not ask for and yet give him exactly what he wanted. There are any number of people in the consuming world today who are constantly using material that costs them more than they should pay if they only knew that there were cheaper items in lumber that would answer their purpose just as well and at the same time move something for the manufacturer that he is anxious to sell.

But here again we have brought to mind the successful salesman, the one who has a thorough knowledge of the product he is selling, has a knowledge of his customer's needs and ability to make suggestions that will be adopted.

Practical Knowledge is Essential

To my mind a thorough knowledge of the product we sell embodies a practical knowledge of how the product is manufactured, some knowledge of how the product is manufactured, some knowledge of competitive woods and substitutes and their availability and at least a general knowledge of grades.

The salesman who has a knowledge of grades can talk with a customer about his needs, learn from him what uses his stock is put to and then help him to decide on the quality he should use. This is especially true of the manufacturer who uses stock that enters into the manufacture of various articles, although to some extent it can also be applied to the retail lumberman.

We all know that there are a great many factories using lumber

that they are pleased to buy, not because it is No. 1, No. 2 or No. 3, but because it suits their peculiar needs; and here again is evidenced the need of a thorough knowledge of the product he sells if the salesman wants to meet with the fullest success.

I will not venture a guess as to what percentage of the lumber salesmen on the road today have a practical knowledge of how lumber is manufactured. I believe, however, that there are a great many who have never had much education along that line, and I know both they and their employers would profit if they took some time off and visited the big, red sawmill. I believe it is a fact that the average salesman today has a very meager knowledge of the different grades, which fact causes both him and his employer considerable trouble at times, because he is sure to go wrong some time or other in his eagerness to get an order. He will make promises for a grade that cannot hold out, just because the promises line up with what the customer wants and the price is attractive; but the day of reckoning comes when the customer gets the stock and finds that No. 3 is not sound knotted, or No. 4 has a percentage of soft rot.

The early part of last year I had a letter from a member of a large wholesale lumber company at Pittsburgh and he told me he had a brother whom he was planning to send out on the road to sell lumber. He said that the brother had had some experience in a retail yard, but he wanted him to get some knowledge of manufacturing and grading before he assumed the duties of a lumber salesman and wanted us to take him on at the mill, where he could get some knowledge of manufacturing and grading. He spent about six months with us at hard labor around the mill and yards, with different inspectors, and I dare say he left there with a better knowledge of manufacture and grades than most of our traveling lumber salesmen have.

The Ideal Organization

To my mind the perfect organization is the one that is made up of men who have been trained at the mill and spent not only six months, but a year, or two years, if necessary, getting the practical knowledge needed before taking up the selling end of the business.

Lumber is not such a simple proposition that any one who is jolly and good-natured and can approach the buyer with a smile and a pocket full of cigars is able to sell it successfully. It is true, of course, that to sell lumber one must be qualified as a salesman, know something of human nature and have a good appearance; but the really successful salesman must first be a lumberman in order to handle the product intelligently.

We have all heard at one time or another this or that salesman tell how he succeeded in "putting one over," and as we believe that practical knowledge is the fundamental basis of successful salesmanship, we can also see that such an education will preclude as impractical the substitution in sale of illogical items.

To "put one over" is merely to destroy a future prospect, and the man who refuses an order because he is aware that the stock will not satisfy, or that shipment cannot be made in proper time to prevent dissatisfaction, is the salesman who is building a foundation for the future.

Without doubt there are salesmen and their companies who are "putting things over." They are probably working on the plan that there is a sucker born every minute and they want their share of them; but the continuance of this practice is sure to bring grief sooner or later. However, the force of salesmanship that comes with self-confidence born of practical experience enables a salesman to offer substitutes that may be entirely acceptable, both as a matter of practicability and economy to the dealer and builder, as well as for the best interests of his employer.

Edward Hines said in an article on salesmanship, that specialization in salesmanship is indispensable today, not because he was quixotic and enjoyed the selection of an arduous road, but for the cold matter-of-fact reason that in modern business there is no other road.

Some Requisite Qualifications

There was a time when lumber was in a class by itself—it had no competitor, and in that day salesmen had nothing much to do but go out and take orders. The situation today, however, is entirely different; the country is full of substitutes and the owners of these substitutes are spending hundreds of thousands of dollars every year in the way of advertising to bring them before the public. That is why I believe that men who are selling lumber should be lumbermen, and not boot and shoe men; that is why I believe it is high time to spend some money advertising, and if we cannot be the "bell cow" let us follow behind and at least keep pace with the substitutes. Some day we may be able to get the lead.

A knowledge of freight rates and a sound sense of values is essential in the education of the successful salesman. Offhand quotations are necessary at times and this knowledge is helpful at such a time, as well as being an important factor in nearly every transaction made.

Enthusiasm in the work is indispensable. The salesman who is not wrapped up in his work cannot possibly get in the same class with the really successful salesman. This is just as true in the business of selling lumber as in any other business. The man who attempts to work in any position without a real liking for the job will not meet with the greatest success. So it is absolutely necessary for the man who wants to win to put his whole ambition and energy into the job at hand and do it better, if possible, than any one else and at least better than he would do it if he were working at it in an indifferent manner. This is true of any job, from piling slabs up the line to general manager; and that kind of enthusiasm spells efficiency. The salesman who has it is sure to dispose of his product to much better advantage than the one without it, and the sales manager who has it is sure to get his product manufactured in better shape, keep his stock in better assortment and close better deals than the one who is without it. It is also essential that the salesman who wishes to be successful should be of good report, cultivate personality, be courteous, patient and accommodating to a degree.

There always comes a time when the manufacturer finds it necessary to call in his salesmen for one reason or another, and just as a sawmill man would be foolish to let a good sawyer, filer or yard foreman go just because the mill is to be closed down for a short time, so would he make a mistake to turn loose salesmen who know the trade and who know lumber. It is not always possible to pick up equally good ones when business revives. Salesmen who are lumbermen are hard to get.

Logging in India—The Elephant's Work

In a report upon the logging industry in Burma, sent by Mr. H. R. MacMillan, and published in the Weekly Bulletin of the Departcent of Trade and Commerce, a description of the teak logging industry is included. "The average out-turn of teak is about 300,000 tons, or 180,000,000 board feet per year, worth about $12,000,000 in the log in Rangoon in normal times. Teak grows scattered in the forest, and the logs averaging one ton in weight, reaching a maximum of three tons, must be dragged on the average three miles to streams. The dragging has up to the present been done by elephants. The supply of elephants is already giving rise to difficulties, the price having risen in a decade from $1,300 to $2,600 each. The elephants require great care and attention; cannot be worked in the heat of the day, can only be worked eight months in the year and where they are congregated in any numbers are subject to anthrax and other diseases. The average year's work for an elephant is the skidding of 120 logs a distance of two miles. The working life of an elephant in logging is ten to fifteen years. The large companies operating in teak and the Government of Burma, which works departmentally, large areas of teak forest, netting a profit of $40 per thousand feet board measure of timber cut, are desirous of introducing machinery to supplement or replace the elephant."

Douglas Fir Ties Popular in England

Douglas fir railroad ties, as a result of recent tests by leading railways of England, have now become so popular in the United Kingdom that the British Admiralty is diverting steamers of large capacity to North Pacific waters in order to secure a supply of fir for British railroad purposes.

The British steamer Photinia recently cleared from the Columbia river with 4,019,965 feet of ties for Queenston for orders, and now the British steamer Breconia, after loading about 1,800,000 feet of ties in British Columbia, is on the Columbia river completing a cargo which is expected to equal that of the Photinia.

Prior to the European war North Pacific lumber cargoes of 4,000,000 feet and over were not uncommon, but since the war the only large capacity steamers that have been dispatched there for lumber, aside from one Japanese vessel, have been Admiralty vessels sent specially to transport Douglas fir ties. The first of these Admiralty vessels was the St. Veronica, which cleared from the Columbia river in March with 3,800,000 feet.

Proper Attention Increases Usefulness of Belts

If manufacturers and dealers in belting could be assured that the belting would receive proper attention and care while in the hands of the buyer they could often sell at a much lower figure.

I know of a manufacturer, for instance, who generally uses a "factor of safety of two" in selling his belting, because he fears the belting will be expected to "take care of itself."

The rule this manufacturer of rubber belting uses is: "Each inch in width, running 1000 feet per min., will transmit one horse power."

With proper care this man states that the figure of 500 could be used just as well, just as safely, just as durably, but he won't risk it.

In buying belts, then, it is well to tell the dealer or mannfacturer just what kind of care you expect to give the belts.—N. G. Near.

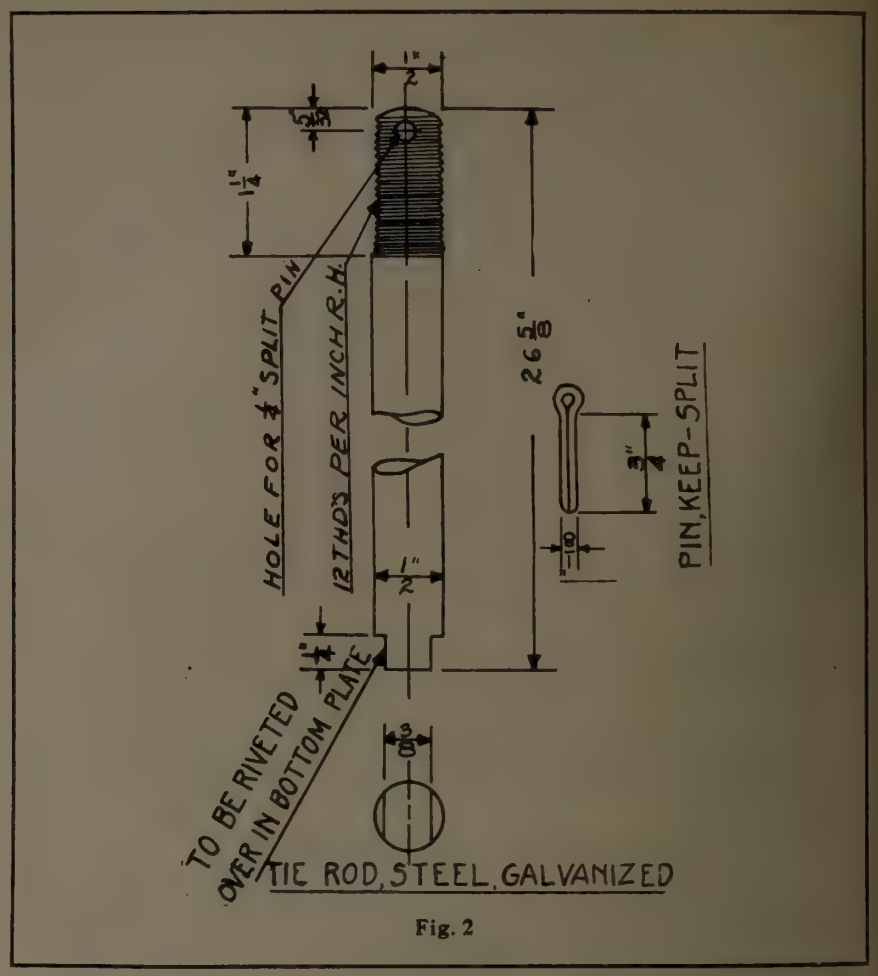

Fig. 2

The New "Bethlehem" Shell Box

The Imperial Munitions Board have issued plans and specifications of a box to be made for the new 18-pounder "Bethlehem" shell. The outside over all dimensions of the box are 27¼ ins. x 10⅜ ins. x 10⅜ ins. It will hold four complete rounds, including fuses and fuse covers. The kinds of wood to be used are spruce, pine or basswood for the top, bottom, sides and ends, and birch, beech and maple for the top and bottom battens and diaphragms. All metal fittings are to be of mild steel galvanized.

The construction of the box is somewhat different from the other boxes that manufacturers are acquainted with. It has a removable end which is held in place by a central spindle that passes through the centre of the box from end to end, fastened with a wing nut. Two small galvanized steel plates are screwed to the bottom and top of the box to keep the head of the bolt and wing nut from cutting into the wood.

Fig. 3 shows a side elevation and end elevation of the box and on the side elevation can be seen the central spindle, wing nut and small steel plates in dotted lines. It will be noticed that the wing nut and head of the bolt do not project past the ends of the box. This is to allow of the boxes being piled on top of each other. The battens that go on the ends are mitred and project ⅞ of an inch over the end pieces, thus forming a rebate for the end to fit into the box.

The three diaphragms or divisions that go inside the box are made of 3-ply hardwood glued up. The centre ply is ¼ of an inch thick and the two outside plys are 5/16 inches, making a total thickness of ⅞ of an inch. The specifications state that these thicknesses are nominal, which we take to mean that the total thickness of the diaphragms may vary slightly from the measurements given. The diaphragms are for the purpose of holding the shells in place. Each one has five holes bored in it, the centre one being a ⅝ inch hole for the central spindle to pass through. The other four holes are for the shells and are a different size in each diaphragm. Those in the diaphragm nearest the removable end are 3 13/16 inches in diameter, those in the centre diaphragm are 3 13/32 inches in diameter, while those in the diaphragm nearest the closed end are 3⅛ inches tapered down to 2 15/16 inches.

A piece of soft grey felt ¼ inch thick is fastened to the inner side of the removable end as shown in Fig. 4 to keep the shells in place and to keep the ends from coming in contact with the wood. The felt is fastened to the lid by means of tacks at each corner. The box has two hand holes for lifting purposes, the shape and depth of which are shown in Fig. 4. The width and angle at which they are cut is shown in Fig. 3.

The wing nut that holds the removable end in place has a ring and chain attached to it to keep it from getting mislaid. The ring has an opening 1 inch in diameter and is made of ring steel No. 13 S.W.G. .092 of an inch wide. One end of the chain is attached to the ring and the other end secured under the lid plate by a small staple. The dimensions and shape of the wing nut are shown in Fig. 1 and the ring and chain in Fig. 8.

The size and location of the holes in the lid and bottom plates are shown in Figs. 6 and 7 and the dimensions of the central spindle

and the split pin that goes in the end of the spindle are given in Fig. 2. The box has three banding wires of two strand galvanized steel wire, No. 16 S. W. G., .064 of an inch tightly bound around the four sides in grooves provided for the purpose and secured by ¾ inch wire nails about 5 inches apart. After the box is assembled and wired, it is marked in two places (as indicated in Fig. 3), with the contractor's initials and the year of supply.

The Canadian Government Railways

The Canadian Government Railways have published a fine set of illustrated folders, describing the great variety of trips that can be made over these splendid lines. One of the best of these is a folder entiled "Summer Excursion Fares, 1916," which contains detailed information regarding the fares for all trips on the Canadian Government Railways Lines in New Brunswick, Nova Scotia, Prince Edward Island, Quebec and Ontario, and to the chief points in Newfoundland. All the publications issued are attractively illustrated and enclosed in handsome colored covers. It is often such a perplexing problem to settle the details of a summer outing that these folders will be of much use to intending travellers. In such an extensive territory as is covered by these railways there is a great diversity of attractions, and they are well set forth in such publications as "Notes by the Way" (Lines Montreal and East); "Notes by the Way" (Lines Quebec and West); "Out-of-Door" (Quebec and the Maritime Provinces); "Abegweit" (Prince Edward Island); "Bras d'Or Lake," "La Baie de Chaleur," and "Storied Halifax." Complete information regarding hotel and boarding house accommodation is included in the folders.

Proper Methods for Laying Oak Flooring

By W. L. Claffey

TO-DAY by improved machinery, equipment and quantity manufacture, the cost of making flooring has been so reduced that beautiful oak floors are now within reach of everyone.

Oak flooring is generally laid by a profession commonly known as floor layers, who specialize in the laying of hardwood floors. These floor layers may be divided into two classes—good workmen and a class that are careless. The expert floor layer obtains his reputation by the high class and perfect work that he turns out. It is practically his only asset in the game. Many large and prosperous floor laying concerns have reached their prosperous condition chiefly through conscientious workmanship in their earlier days. The floor layer who is careless in his work will never succeed.

It is not necessary to be an expert to produce a good floor laying job, but it is very essential that considerable care should be exercised and all the details from the very start to the finish should be carefully studied before the floor laying work is taken in hand.

Before starting to lay oak flooring, the stock should be examined to ascertain if it has absorbed any moisture while at the lumber yard, on the wagon, or at the job, as usually during rainy weather, oak flooring will absorb considerable moisture, mostly at the ends—thereby causing it to swell as much as one-sixteenth of an inch. If this condition is not discovered before the floor is laid, unsightly crevices will appear in the floor. The sub-floor, as well as the plaster work, should be thoroughly dry before starting to lay oak floors. If in winter, the rooms should have a temperature of about 70 degrees to insure the best results, and the oak flooring bundles should be in the rooms at least ten days to thoroughly dry out, in case the stock has been subjected to any moisture, before the main work is started.

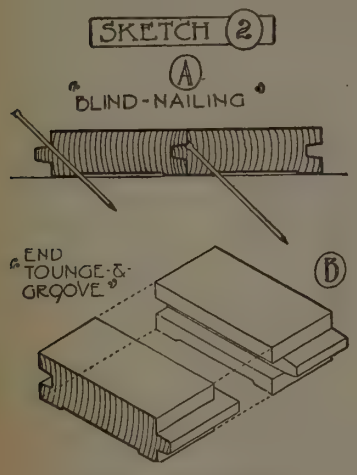
Oak flooring leaves the mill in perfect physical condition. but is very often abused by improper handling before it reaches the job. There are many lumber yards and contractors that almost treat oak flooring like rough lumber. This is a mistake.

The sub-floor should be thoroughly swept and it is well to use a damp proof paper and where sound-proof results are desired, a heavy deadening felt is recommended.

The sub-floor should be of serviceable wood, but not less than 7/8 in. thick, dressed one side to an even thickness. Sub-floors should be nailed securely to the joists, but not driven too tight together so as to permit it to swell, then bulging; four-inch to six-inch strips are preferred widths for sub-floors.

When strating with the first oak flooring strip, it is well to leave at least 3/8 in. for expansion space between the first strip and the baseboard, and likewise at the other end of the room, as there is more or less expansion and contraction in all kiln-dried oak flooring.

Oak flooring should always be laid at an angle to the sub-floor and after laying and nailing three or four pieces, use a short piece of hardwood, 2 in. x 4 in., placed against the tongue and drive it up with a heavy hammer.



OAK FLOORING

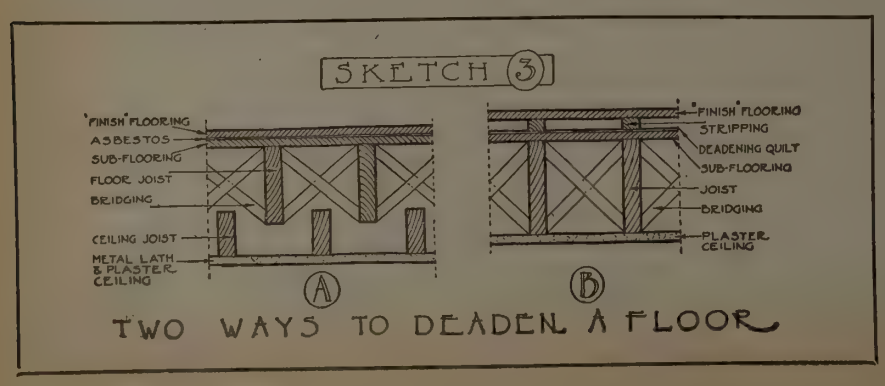
The nailing of oak flooring is very important. All tongued and grooved oak flooring should be blind nailed. The best flooring made can be spoiled by the use of improper nails. The steel cut variety is recommended for 13/16 in. stock—use 8-penny nails every sixteen inches; for 3/8-inch flooring, use 3-penny wire finishing nails every ten inches. If even better results are desired, the nails can be driven closer.

The floor layer should use discretion in regard to certain strips that do not blend in color with the majority of strips. A few badly discolored pieces in a room will mar the appearance greatly. Bad discolored pieces should always be set aside and used in closets and other out-of-the-way places. Where there is a wide variation in color, it is good policy to separate the pieces before they are nailed down. This insures a more regular run of color and blends better together than if scattered throughout all the rooms. Every floor layer should watch this feature of his work closely, as it is the appearance of the floor after laid that counts.

Oak floors, with some care, should last a lifetime, and it is for this very reason that all floor layers should be very particular when they lay oak flooring. The wood itself is practically never permitted to wear—that is, in the better grades that are used in homes. It is the wax or varnish finish that wears, which is always replenished. Honest and careful workmanship on the part of the floor layer spells success. A good job of floor laying is the best of advertising, while a poor job gets nothing but kicks and no reward.

Scraping oak floors is always done in the better grades, or in all homes where people dwell. In order to get the best results for a nicely finished surface, it is best to scrape it. This scraping process can be done by the ordinary scrapers, such as used by cabinet makers, or by one of the many types of power or hand machines that are generally used by contractors and carpenters. Always scrape lengthwise of the wood and not across the grain. A floor properly scraped looks very smooth, but it should be thoroughly gone over with No. 1½ sand paper to obtain the best results in finishing. After this the floor should be swept clean and the dust removed with a soft cloth.

The floor is then ready for the filler, which should be put on as soon as possible after the laying work is finished, as the filler fills up the pores of the wood and keeps it from shrinking.



New Methods Bring New Problems to Retailers

The business of a retail lumberman is associated largely with knots. The values of the different grades of his stock are determined by the quantity and quality of them. They enter into his relations as buyer and seller and there is scarcely a day passes but that this feature of lumber is given his thought and attention, either in ordering his stock or selling it to the consumer. His lumber is graded with reference to knots, but his customers don't always accept them with the same willingness and understanding as he does, and hence some of his difficulties in selling the stock as it has been graded out to him. But there are other features of his business also that are as knotty as his lumber and vary in relative character as they do. Some of these knotty questions he has to deal with are chronically troublesome. They bother him a good deal until he has learned to mitigate their worst features.

Probably the most knotty problem the average dealer has to contend with is his local competition, which in the whole business generally may be said to be harder to deal with than any other outside competition. I have talked with a good many dealers on this subject and with few exceptions they all have testified to being troubled with their local competition more than anything else. This is something, of course, that they won't admit to everybody and they would not like to have it known to their competitors. Some dealers have told me their relations with the other yard were pleasant and agreeable both socially and in a business way. Others have said there was a working truce between them that they had to be careful about doing anything that would break it up. So in practically every case where there are two or more yards in a town the relation between competitors is always an underlying consideration with each of them, and unconsciously their thoughts and actions are more or less influenced by it.

It would be interesting to know how much we are influenced by our competitors. None of us, I believe, has figured that out, but it would be a good thing for us if we would analyze ourselves in this respect. Some dealers pride themselves in feeling and acting independently. Nevertheless an x-ray of their mental consciousness would reveal a good deal to the contrary regarding their competitor. However much we may ignore what our competitor may feel and do towards us, we cannot escape the subconscious interest which exists as to what and how it will affect us. We can't get away from this no matter how great our don't-care attitude may be regarding him. No doubt there are many dealers who have been getting along comfortably with their competitors and wish to avoid doing anything that would have a tendency to disturb these harmonious conditions. It is this feeling, I believe, that is responsible for much of the lack of advertising among the retail lumbermen, or of any special effort to develop business.

Disturbs the Equilibrium

Where two dealers are working in harmony one of them may be of a more progressive nature and would like to put into practice some of the more modern ideas of creating more business. But his competitor is averse to doing anything different from what they have been doing, and argues, "Why not let well enough alone?" His thought, of course, is that if the other man advertises and goes out among the farmers and induces them to build better homes and make other improvements, they will naturally give the business to him, and therefore the balance of trade will be greater for the progressive competitor than it has been, and unless this man can be induced to join in and alopt the same policy, it begins the parting of the ways between them, and the old harmony has departed. This constitutes the knotty problem for the progressive and enterprising dealer who

is "hooked up" with a competitor who don't believe in such ways of doing business and is obstinate in his refusal. In such a case he knows that if he persists in carrying out his new policy he is going to stir up the antagonism of his competitor, and this means a business war where there had been a peaceful situation. It is difficult to avoid this, because through his advertising he will draw more people to him and among those who come to consult him about building will be some of his competitor's regular customers. And if he succeeds in selling them a bill of material for a building specified according to his plans, the devil will be to pay with the losing competitor, for, taking customers away from a competitor is, in a country town, a matter that is not borne with equanimity by the loser, and he is pretty apt to retaliate in some way or other that precludes the continuance of friendly terms.

Those who run yards in the large places do not realize what it means to do business in a small town and be in a state of war with the one or two competitors that you see and are apt to meet every day. Like a running sore it is a constant irritation to the feelings and takes a good deal out of the pleasure of living. The ideal state of doing business in such places is to have a friendly competition, and where this exists it is, I think, more satisfactory than to be the one dealer in a town, for no matter how fair you are to the trade, you cannot escape more or less of suspicion that you are taking undue advantage of your position. And there is this constant lurking fear with the lone dealer, also, that the volume of business he is doing will attract the attention of some one who is "snooping around" looking for a place to open up a new yard. It is this fear that acts as a restraint on some men in these single yard positions and who are content with the amount of business they are doing without making any special effort to increase it. They don't care to attract attention that will draw the bee-hunter to the honey tree.

Stating Things as They Are

You understand, of course, that I am not advocating this attitude nor way of doing, but I am stating things as they exist and the general feeling among lumber dealers in the country towns. And things as they are in this respect are facts that are difficult to change. When I put my thoughts on things pertaining to the lumber business, I don't think of them in the light of what they are in the cities where a dealer rarely meets with the consumer and deals mostly with men of some business training, but I surround myself, as it were, with the atmosphere of a country yard and its relations to and with no others than the ultimate consumers. Having been for many years a country dealer myself, I know the attitude of country men of business regarding may things which the city bred business man accepts as the regular and proper thing to do, because it is demanded by the conditions under which he does business. The radical difference between a city yard business and that of a country yard gives the city and country dealer the same divergent point of view, and in my writing I am more apt to look at things from the alleys of a country yard. So, when I read of what is being done to get the country retailers to change their policies, I naturally consider them from the viewpoint of practicability.

I often think of the mass of lumber and building literature that is being fired at the country dealer for him to read and influence him to adopt the ideas of men, some of whom have no adequate realization of what it is to run a country yard, because they haven't had the experience. Many of these ideas and projects are good and helpful, but the parable of the sower might be fitly applied to them. From what I know of the average dealer most of this stuff that is sent out is perhaps merely glanced over and laid aside. He has too many other things claiming his attention all day long to find time or be in the mood to read. Some, of course, will read what they can and profit by it, but to adopt everything that is suggested in this reading matter is another thing. Some can be profitably adopted without regarding the competitor, while others will make him pause on account of his friendly relations with the other yard. Regarding this literature, I would advise you not to throw it aside as waste matter, but rather lay aside a little of your spare time for the purpose of giving it attention. Treat it as you would a menu card at an hotel. You don't try to eat everything there is on the menu, but you look it over and pick out what you want. You can pick out a good deal in this reading matter that will not only give you a better and broader knowledge of the lumber business, but will be really helpful in your business as well. I would say this especially to lone yard managers and their "second" men, for everything you learn about the business you are engaged in will make you all the more valuable to your employers, and values are what salaries are based on.

It Will Change Old Relations

The progressive dealer who makes up his mind to make a change in his methods, or adopts some change that he believes will materially increase his volume of business without regarding what his competitor will think or do, is confronted with the necessity of cutting loose from some of the old entanglements that hitherto have kept him from exercising the freedom of action that his progressive and aggressive nature has prompted. If he is a persistent and attractive advertiser, he is bound to excite the attention of people living outside what is considered as the natural territory of his town, for it is a sure thing that people are attracted to a man who advertises to give a class of service which they are not in the habit of receiving from a lumber yard.

A man who is going to build a house is having one of the times of his life and is open for any information concerning it. And whether he lives two miles away or is a resident of a neighboring town he is going to ignore his home dealer who is not as enterprising and offers no extra inducement, and go and call on the dealer whose advertised offers of service have attracted his attention. If, perchance, he brings his wife with him and together they look over the plans and make their choice of one of them, this dealer will naturally try his hardest to make a contract to sell the bill of material for it, whether it will go out of his territory or not. He considers that the stranger coming to consult with him is the blossom of his advertising and his selling the bill the fruit of it, and, moreover, it is perfectly legitimate. But, as all of us dealers have experienced, the dealers in the town whose territory he has invaded will strongly object to his taking what they believe belongs to them. And here comes up the knotty question I have before spoken of. What is the common sense way of dealing with it? In the event that the dealers interested are members of the same association the feeling over it is liable to be intensified.

In the old free-for-all days we made no bones of selling a bill if we could to any man who asked us for an estimate and didn't care a darn where he lived. But ethical considerations have come into the business since then and as a rule dealers have given more recognition to territorial rights. It is easy to figure out the territory and lay down rules regarding it, but while the dealers may do this in order to promote friendly relations between them, the other interested party, the public, is not supposed to have any knowledge of this and would resent anything of the kind if it did. Consequently there is a constant liability of customers in one territory going over into another territory to exercise their right to buy where they please, and therefore making potential trouble between the dealers of adjacent territories.

Ordinarily where the dealers are doing business along the old lines allowing the trade to come to their yards without any particular effort to solicit it in a public way there is very little of it going from one territory to another, and whenever such a case occurs the matter can be amicably arranged with the dealer whose territory has been invaded. But with the injection into the retail lumber business of the new and aggressive methods of creating and soliciting business through advertising in the local papers, plan book systems, and all the other devices for attracting and stimulating people to do what they didn't think they wanted, and all this with a view of getting the business for the yard that goes after it in this manner, the natural result will be that it is bound to have a disturbing effect on the relations of the dealers in the same locality and neighboring towns. It will probably be more aggravated at first and continue until all the dealers have adopted the same methods. But conditions are such that this is not likely to be and the "longest pole will knock the persimmons" as it always does in business competition, whether in the form of the lowest price or the methods of modern merchanidising. The aggressive dealer with the new ways of going after business is bound to draw trade away from the non-progressive dealers in his locality, even though he gets it at his own prices, and it is not his fault if people living in the territories of other towns come and give him their business.

It Would Penalize Ability

Now, to restrict such a dealer to the narrow limits of an arbitrary territory is to penalize him for his ability and enterprise. He spends, say, $500 to $1,000 a year in advertising, and other devices for attracting trade where his competitor don't spend a quarter or a tenth of that. Now, is he not fully entitled to all the benefit that comes to him because of his legitimate enterprise? If his attractive advertising brings a customer from another town and he gives him the benefit of his office service and square deal in the sale of his bill, is it reasonable that he should be required to make a division of his profits with the dealer in that town who hadn't the enterprise to go after the trade he thinks belongs to him? Does it seem reasonable to expect a man to pay a penalty for his own enterprise?

I have been thinking a good deal the past year on this subject. I see a new order of things evolving itself in the retail business and it seems obvious to me that sooner or later we will have to reconstruct our ideas on the question of territorial limits and divisions of trade generally. It looks to me as though the trend of things is forcing the doing away with them altogether in our consideration. It looks, too, in the retail business that to him that can get shall be given, and to him without the modern enterprise shall be taken away what he hath. In other words, the non-progressive will be crowded out of the business or else he will have to be content with a minor share of the trade. Good roads, the auto truck, and the service of the modern yard will eliminate all the old imaginary lines of territory between adjacent towns and the business will be for those who best can serve their customers. But this is looking some way ahead of what the actual con-

ditions are to-day. I am simply voicing my opinion as to the tendency of the evolution that is going on in the trade.

Many of you are to-day in a state of mind favorable to the taking up with an intensive system of advertising and some of the other service stunts that modern merchandising requires. If you feel this way, I would advise you not to be deterred from doing it on account of your competitor who may not feel as you do in the matter, even though your business relations may be satisfactory. But before going into anything of the kind it would be good policy on your part to have a talk with him and inform him what you are thinking of doing and propose to him that he do likewise and work in harmony with you to create more business for both and make the town a distributing point for all those who are attracted by your advertising and modern service policy. If you can get right with him in this regard, you will find it more profitable, no doubt, than by "playing a lone hand," because if you go it alone, your competitor will, of course, in order to hold his trade, retailiate on you by cutting the price of bills you have worked to secure and otherwise demoralize the business. Team work like this will be a competition, or rather emulation of service, instead of a competition of prices. However, let nothing deter you from consenting with yourself to carry out a new departure in your business methods. If they are of the right kind and you pursue them with good judgment and sense, you are bound to win out in spite of competitive opposition. C. H. Ketridge, in the Mississippi Valley Lumberman.

Operating Costs in the Retailing of Lumber

By Julius Seidel *

The subject assigned to me, and on which I am to speak, is one that on the surface would appear, or seem to be, extremely simple. It would be easier of solution were we to discuss the matter from a local standpoint. To illustrate: when there are several lumber yards operating in one and the same town, under like conditions as to unloading and piling charges, average distance of haul, amount of stock necessary to carry on business, general expense as to help, rent and taxation, we could reach a cost that would be uniform and nearly correct.

The manufacturing or mill end of the lumber business is, in a measure and to my mind, more simple of solution; yet it, too, finds many exceptions to the adoption of fixed rules that would definitely fit all conditions of the industry. In the retailing of lumber the problem of operating cost becomes, by the very nature of things, more complex. The fact of the matter is this: Men engaged in the lumber business have never so segregated their departments as to be able to say definitely what the operating costs amount to in dollars and cents on the various class of sales.

A retail lumber yard occupies a unique position in so far as it proposes to serve the public under the slogan, "No sale too large for our capacity or too small for best attention." F.o.b. shipments to a factory under construction, a wholesale order for several cars hauled direct from the track to the building, or for factory use, the jobbing carpenter's order, or the catch-penny sale of one board, all usually go through the books under the same caption of a "lumber sale." When the year is over percentages of doing business are figured by a summing up of all classes of trade, or sales, dividing the sum total by the footage in order to arrive at a price per thousand or per cent. basis. By this method a very vague and very incorrect idea of the cost of retailing lumber is gained.

Just now the industry is confronted with the matter of service in deliveries. In the cities the hauls have become longer and the time set for the delivery, no matter what the amount, shorter. In the rural districts the demand is becoming more acute for house deliveries. Everything is leading to a specialization of effort. The farmer feels that he is better served when the lumber yard itself hauls the lumber on a lumber wagon, driven by a lumber teamster, who also unloads the material in a careful way. It is my opinion that we should cultivate and expand upon the service and thus be better able to develop a real building up of communities.

Lumber, as a whole, is not generally shipped into a point where the dealer has been sufficiently wideawake to handle his business as a business and to push it with the enthusiasm that is back of city concerns.

Computing Operating Costs

In the computing of operating costs we must arrive at two essential things: labor incurred and overhead expense. Under labor we have the piling charges, hauling into the yard and hauling out. Very few yards are entirely free from hauling in, even though they have their own switch. Hauling about your own yard should, however, more properly be considered as a piling charge.

1. Piling Charges.—Putting lumber into a pile is only part of the job. The full piling charge should be the putting into pile and again putting it on the wagon. This work is costing more every year. Lumber was formerly sold more in the random lengths and widths; it was not graded so scientifically, that is, there were less grades. To-day a retail yard must make up small piles of 4, 6, 8, 10 and 12-inch widths and also separate the lengths from ten feet up to twenty feet. That means thirty piles of No. 3 boards, thirty piles of No. 2 and thirty piles of No. 1. Stick piling is slow work, as compared with piling in bulk, and the cost to you of giving a customer just the exact width, length and grade must receive serious thought.

2. The Rent Charge.—When the lumber is in the yard and piled, that horrible landlord immediately claims a part of the pile, and if he has given you a nicely levelled or rolled lot on a good business corner he should get his compensation. Perhaps you are your own landlord. If you are and do not collect rents on your business lot, on its commercial worth under a re-valuation clause, every three to five years you are unfair to yourself and a detriment to the lumber business.

3. Employer's Liability.—Then you reach the matter of liability occasioned by accidents, and take out a policy so that you may not be wiped out by a judgment, something that may happen when you least expect it. This means paying a bill for employer's liability on your labor and teaming, and public liability as well.

4. Teaming.—The matter of service is now flashed upon you. The public wants "sudden deliveries" and you must be ready to give anybody any quantity of lumber, delivered anywhere at any hour of the day. So you line up to the horse trader, harness shop and wagonmaker, and you may even flirt with the auto truck salesman, for the purpose of getting hauling equipment. Since good service is worth good money, the buyer should either pay for delivery service at its full value or buy his own delivery outfit. Delivery of lumber is an actual labor charge and should not be donated. If the horses don't get enough exercise hauling lumber at a profit, better sell some of them and the wagons rather than commit commercial suicide by throwing in the hauling on a sale.

5. Improvements.—Of course, you want a shed to keep the finish free of stain, protect it from warping and twisting in the good old summer time, and to avoid using a pick-axe to get a board loose during the icy season. Sheds in lumber yards, also stables, warerooms, fences, driveways and roadways, and even an office with very modest furnishings, cost real money. You may get a notice to clear the place after the ten years' lease expires, so better figure on 10 per cent. depreciation on original cost per year. Lumber yard improvements are worthless when you vacate the lot.

6. Fire Insurance.—Supposing an old tramp, one of those mean kind, smoking a corn-cob pipe, should become infatuated with one of your "soft pine" boards, with just a little resin on the surface sufficient to ignite when the tobacco ashes fall upon it during the peaceful slumber of trampy dear. Of course, you took out fire insurance before that could happen, and you got a bill for it, too, and paid it promptly.

7. Advertising.—Well, when the yard is ready to open up you want to advertise the fact to the world. Should you be a bit old-fashioned, you will spend less for publicity than you would were you a pushing chap; but spend you do, and pay you must.

8. Salesman.—Do you need a salesman? Well, I just reckon yes; in fact, the best is none too good for your yard. Every retailer I ever met has the best solicitor in the "profesh" and a good man is always worth his hire; besides, you will have some collections to make, so he fills two jobs—"pushing and shoving."

9. Office Help.—And you need a mild-mannered, pleasant looker for a clerk, one who can take abuse from both customer and the boss and never hear it. He is dirt cheap at $60 per month and he is down "for keeps" on the pay roll.

10. The Boss Himself.—Well, well, we've quite overlooked the fact that the concern really needs a head to it to make up the organization. Bosses do little and come high, but they add dignity to the company. So we engage a boss.

11. Office Supplies.—Pretty soon we order the 'phone, desks and chairs, estimate blanks, dray tickets, filing cases and books. Severally they are hardly worth charging up, but collectively it takes the small coin in the corner of the vest pocket to pay the bills.

12. That Merchants' Tax.—Just as you feel jubilant on having done pretty well for a beginning in the way of sales a round-faced, red-nosed, round-bellied little man of 250 pounds lays a sheet on your desk, requesting you to tell the city collector on the quiet how much those sales amount to, as a little merchants' tax money is really handy coin for keeping up community expenses.

13. Community Duties and Sundry Expenses.—Of course, your being in business puts you in the prominent business class and you are entitled to all of the "pay and look cheerful degrees" of that strata. Donations for conventions, church festivals, civic leagues, public welfare, Boy Scout movements, etc., take a little, and as a matter of course you "chip in" on all of it for fear of being enrolled under the illustrious order of crabs. Then come the little incidental expenses, such as car fare, errands, free samples, getting the customer something, repairs, a coat of paint on the floor, coal for fuel, and a little light when

* Address delivered before Annual Meeting of Southern Retail Lumber Dealers' Association, Memphis.

the sun is down and out. Even so do they sum up and add to the high cost of doing business right.

14. Attorneys' Fees.—And to cap the climax, we find that, after getting our incorporation papers, it might be well to have a counsellor. The customer's lot may have an adhesive plaster that would stick better than lien paper and, therefore, we have the title solemnly examined. The farmer's crop was not what he expected and a little second deed of trust, with monthly notes, properly drawn by "our" lawyer is put on record. Of course, a lawyer costs a bit, but he saves his hire by avoiding the cliffs. So he is down on the expense account.

15. Profit and Loss.—In spite of your precautions you meet men with memories constituted so conveniently that statements, coupled with a request for payment, are handily overlooked and forgotten. Then, there's the crook and deadbeat, who feels that you can afford a loss while he is blamed sure that he himself cannot, as he has nothing to lose. It is fate or destiny that forces you to devote a page on your pretty, ruled ledger to profit and loss.

16. Interest on Permanent Investment of Stock.—Then, to top it all off, do you know that those horrid millmen will only allow a sixty-day limit in which to "ante up" for the stock you buy? That forces an issue, namely, that of making you cash in all your safe investments and cash out to the millman. All your money is, therefore, transferred to the yard and there it sticks permanently and for keeps. Now, money is worth 6 per cent., and on a basis of $25 per thousand feet and a turn of your stock three times during the year, it figures just 50 cents per thousand feet for interest that you must get out of your investment. If your sales can't with certainty produce that on your business, better get back to loaning out your money to the other fellow and let him do the worrying.

So, to sum it all up, suppose we say that lumber on a 20-cent rate is sold by you at $26.50 per thousand delivered on the job. That would mean about a $20 cost basis to you on cars. Out of the $26.50 you have to get back the actual labor charges and the overhead you put up in real money, which, in reviewing the matter, is as follows:

		Per M. feet	Based on cost of $20 per M. Per cent
1	Piling up and putting on wagons	$ .80	4
2	Rent of ground	.50	2½
3	Employer's liability	.04	¾
4	Teaming: Hauling in and out	.75	3¾
5	Depreciation of improvements	.27	1¼
6	Fire insurance	.10	½
7	Advertising	.24	1¼
8	Salesman	.28	1½
9	Office clerks	.32	1½
10	Officers (the boss)	.50	2½
11	Office supplies	.10	½
12	Merchants' tax	.05	¼
13	Community dues and sundry expenses	.10	½
14	Attorney's fees	.05	¼
15	Profit and loss	.10	½
16	Interest on permanent investment	.50	2½
		$4.70	24

I hope that you added a profit of 10 per cent., but don't forget that it is necessary to add 24 per cent. to your f.o.b. cost if you want to get your actual cost.

Figures are Trustworthy

The figures submitted by me are absolutely trustworthy, as they represent an average cost of operations taken from reliable sources and covering a period of time adequate for a true barometer. Having given you a basis to work on, you are now at liberty to adjust the percentages of the various items, making up the whole to suit your conditions. The fundamental costs are, however, before you. It has been unfortunate that you have ofttimes persisted in paring down these fundamental costs to such a narrow margin as to get close to the danger line. It seemingly often has been the pleasure of many yards to see how near they could get to the flame without being burned.

Chart on Cost of Hauling

I have prepared a chart of just one item, namely, hauling, which shows you actual cost of service.

Cost of hauling lumber tabulated to show price per thousand for full, also part wagon loads on long or short hauls:

Time	Team	Loader	Total Cost.	Loads 2,500 ft.	Loads 2,000 ft.	Loads 1,500 ft.	Loads 1,000 ft.	Loads 500 ft.
1 hour	$ .50	$ .25	$ .75	$ .30	$ .37½	$ .50	$ .75	$ 1.50
2 hours	1.00	.25	1.25	.50	.62½	.83 1/3	1.25	2.50
3 hours	1.50	.25	1.75	.70	.87½	1.16 2/3	1.75	3.50
4 hours	2.00	.25	2.25	.90	1.12½	1.50	2.25	4.50
5 hours	2.50	.25	2.75	1.10	1.37½	1.83 1/3	2.75	5.50
6 hours	3.00	.25	3.25	1.30	1.62½	2.16 2/3	3.25	6.50
7 hours	3.50	.25	3.75	1.50	1.87½	2.50	3.75	7.50
8 hours	4.00	.25	4.25	1.70	2.12½	2.83 1/3	4.25	8.50
9 hours	4.50	.25	4.75	1.90	2.37½	3.16 2/3	4.75	9.50
10 hours	5.00	.25	5.25	2.10	2.62½	3.50	5.25	10.50

My sole motive in doing this is to bring vividly before you one of the great problems of the present. The per thousand feet cost is of as wide a range as are the opinions of lumbermen on the cost of each and every item submitted to you, and that makes up the sum total of $4.70 per thousand, or 24 per cent.

Cost Influenced By Market Price

The cost of business is influenced by the market price, or basis price, in your town. If your average cost is $15 per thousand, your investment is lighter than in such towns where averages are well up to $20 per thousand. In those towns near to a source of supply of native lumber we can figure on turning the stock oftener. These cases, however, do not weigh in the balance and would not affect the averages to any degree.

To be fair about cost, we must go to towns and cities of a population sufficiently large to assert themselves and express a demand for all of the modern woods. The yards that are trying to keep full assortments cannot hope to turn their stock more than three times a year under normal conditions. Our country, as a whole, has passed the era of mushroom development and is assuming an air of permanency. Boom sales are past, and we should heed the demand of the times—to keep more complete stocks, give better and more efficient service. Recently I had occasion to learn that one of the most successful department stores of our city is operating with an overhead of 27 per cent. Large business formulates a policy and charges for the service. When it sets aside a fixed sum for advertising, this sum becomes a part of the overhead expense. The lumberman, however, considers advertising a donation and parts with the coin begrudgingly. You must make up your mind to set aside a certain amount, say at least 25 cents per thousand, for the promotion of lumber and let the consumer pay for telling him the story.

For years it has been my opinion that associations should enter upon the field of supplying their members with the means of getting books of entry, accounting and auditing systems at a reasonable price. It would create an awakening and standardize an industry which has been working along the lines of uncertainty as to operating costs.

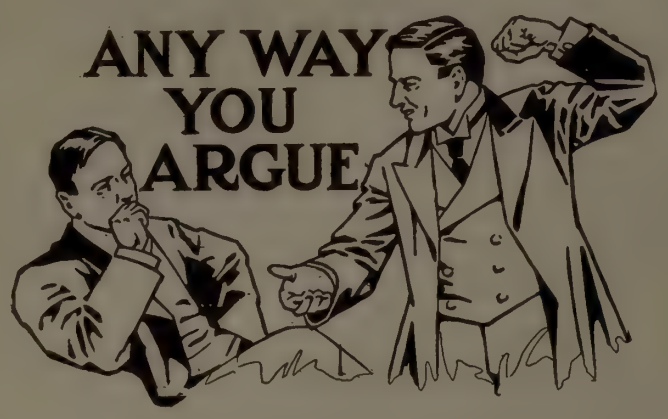
My own conclusions are that for the house bill trade, for complete service of furnishing a bill of lumber at such times as it is required, and in such loads as needed, during the construction of the building, we should add from 30 to 35 per cent. to the f.o.b. market value at the time of sale. On retail sales to the consumer I do not see how you can do business for less than fifty per cent. The demand for auditors and business systems is an outcome and demand of the times, and the retail lumber business should respond to this demand. The manufacturers are making a gallant, open, aggressive and educational fight to educate the trade as to the best use of wood. We must appreciate our duty equally as well by supplying and serving the public in a manner that commends itself to them. The fundamental idea is to do the service well and charge for it.

The Minister of Lands of British Columbia reports that while no sawmill timber is being logged in the Fort George forest district, present operations being confined to the taking out of timber for bridge and road construction, mining development, and cordwood, the future of the lumber industry in that country is looked upon as being hopeful. The prairie demand for lumber has enabled one firm to resume cutting from a stock of logs which has been on hand for years, while another concern is preparing to start up again. The recent reduction in the freight rate on lumber between that district and Edmonton will have a favorable effect, and encourage the mills to cater for other than local needs.

Shells for Huns Made at the C. N. Exhibition

Though munitions of war are being turned out in hundreds of Canadian factories, few but the men actually engaged in the work know anything of the system employed, the process being one of the most closely guarded of war secrets. The veil will be lifted when the Canadian National Exhibition opens on Aug. 26. Permission has been obtained from the War Office, through the Canadian Government, to show the processes of manufacture, and several machines, operated by skilled workmen, will be engaged for the two weeks turning out shells and projectiles for delivery to the Huns through the gun muzzles of the Allies.

Lieut. J. G. Shearer, 1st Regiment, Grenadier Guards, president and managing director of the James Shearer Company, Limited, dealers in lumber, sash, and doors, Montreal, has been presented by Col. J. A. Fages with a parchment testimonial from the Canadian Royal Humane Society, in recognition of his gallant services in February last in stopping a runaway horse in Montreal. The presentation was made at the close of an inspection of the Guards.



"There's One Best Way"

There's one best way to buy and sell special lots of lumber, second-hand machinery, timber lands, etc., and that is by inserting a small advertisement in this department.

Every mail brings word of big results from these small ads. Last week a large lumber firm sold their entire 1916 cut, several million feet, through an advertisement on this page.

What Have You to Advertise?

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Birch Wanted

WANTED—10 Cars 2½ in. No. 1 Common and Better Birch for Fall delivery. Buffalo Hardwood Lumber Company, Buffalo, N.Y. 14-17

Wanted—Lath

Please quote us your best cash price on the following, either delivered Cleveland, Ohio, or F.O.B. Mill, giving rate to Cleveland:

⅜ x 1½ — 4 ft. No. 3 White Pine Lath.
Same—Red Pine.
Same—Spruce.
⅜ x 1½ — 4 ft. No. 2 White Pine Lath.
Same—Mill Run White Pine Lath.
Same—Spruce.

THE AMERICAN LUMBER CO.,
1502 New England Building,
12-15 Cleveland, Ohio.

For Sale–Lumber

For Sale

2,000 Cedar Poles 25 to 45 ft. long; 4,000 Cedar Fence Posts 4 in. and up, 8 ft. long; 2,000 No. 2 Cedar Ties, 3 in. face and up. Lynch & Ryan Lumber Co., Marmora, Ont. 12-15

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
e Montreal, Que.

Wanted–Machinery

Machinery Wanted

One second-hand Alligator. Machinery must be in good condition. Will pay cash. The Field Lumber Company, Limited, Field, Ont. 13-14

Lorries Wanted

Fifteen second-hand lumber lorries, must be in good condition. Campbell MacLaurin Lumber Company, Limited, Drummondville, Que. 11-14

For Sale–Machinery

For Sale

One 30-in. Double Surfacer; one 6-in. Four Sided Moulder; one Self Feed Rip Saw; one International Gas Engine, 12 Horse Power; one 50 Horse Power Corliss Stationary Steam Engine; all in first class working condition. Apply Box 421, Canada Lumberman, Toronto, Ont. 13-14

Saw Mill Machinery For Sale

Two (2) New Waterous Band Mills.
Two (2) 2½ A. Log Carriages.
Two (2) Gun Shot Steam Feeds.
One (1) Dittbener Band Re-saw.
One (1) New Champion Edger No. 405.
One (1) Standard Two-saw Trimmer.
One (1) Overhead Slat Slasher.
Lath Mill Machinery.
Rolls and Drives.
Transfers.
One Refuse Hog.
Sorting Table.
Filing Room Machinery.
Live Rolls, Boxes, Shafting and Driving Chain.

All of the above is new and was never used.

For particulars write to Bayl ss Pulp & Paper Company, Binghampton, N. Y., U.S.A.

Machinery can be seen at any time at Beaupre, P. Q. 14-14

Machinery For Sale

A small "Ad" under this heading, telling of what machinery you have for sale, will immediately put you in touch with buyers. Send us a list of machinery items and we will quote you on a small "Ad." Send the list now, before you forget about it. 1-t.f.

FOR SALE

Woodworking Machinery

1 Woods No. 32 Matcher; 1 Goldie 10-in. Moulder; 1 Goldie 24-in. Matcher; 1 Cowan 42-in. Sander; 1 Jackson Cochrane 36-in. Sander; 1 Egan 36-in. Single Surfacer; 1 McGregor-Gourlay 2-drum 30-in. Boss Sander; 1 Egan 30-in. 2-drum Sander; 1 CMC 8-in. 4-side Sticker; 1 McGregor No. 212 30-in. Double Surfacer; 1 No. 180 Berlin 30-in. Double Surfacer; 1 American No. 26 Hardwood Matcher, with boring attachment and end matcher; 1 Ballantyne 12-in. Sticker.

P. B. Yates Machine Company, Limited,
13-t.f. Hamilton, Ont.

Machinery For Sale

Woodworking Machinery for sale, consisting of Planers, Band Saws, Hardwood Flooring Machines, Mortisers, Buzz Planers, Shapers, Mitre and Tennoning Machines, etc., also Steam Boilers and 300 H.P. Steam Engine, Shafting, Pulleys, and large quantity of leather belting. Also a complete Sawmill outfit, a large stock of Rough and Dressed Lumber, Sashes, Doors, etc., manufactured and in process of manufacture. Reply to the Tobin Manufacturing Company in Liquidation, Bromptonville, P.Q. 12-15

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Young man, four years experience in sawmill office as stenographer and bookkeeper, desires change. Good references. Box 424, Canada Lumberman, Toronto, Ont. 14-16

POSITION WANTED—By man thoroughly experienced in lumber, either in the woods, around the saw mill or in lumber yard. Ready to go either east or west, but Ontario preferred. Address Box 415, Canada Lumberman, Toronto, Ont. 14-14

BAND OR CIRCULAR FILER or Mill Foreman wants position. Twenty-seven (27) years' sawmill experience. Gilt edge references. Box 405, Canada Lumberman, Toronto, Ont. 11-1

Business Chances

Timber Tract and Mill

Valuable Timber Tract, British Columbia; nearly 10,900 acres; 60,000,000 feet of timber; on railroad. Local market for mine props. First class mill, 30,000 feet daily capacity. Very attractive proposition. George W. Grant, P. O. 1676, Calgary, Alta. 13-16

Timber Limit For Sale

Thirty-six square mile limit, North Shore, License allows cutting all kinds of timber. Contains Hemlock, Birch, Spruce, Pine, Cedar Ties and Poles, Pulpwood and Hardwood. Railroad runs through part of berth. Cheap operation. Splendid opportunity for small mill. Apply Box 423, Canada Lumberman, Toronto, Ont. 13-t.f.

Business Opportunity

Make your opportunity knock at the door of every Lumberman in Canada by placing a small "Ad" about it in this column. Our rate is $2.10 per inch per issue. Now is a time when monied men are seeking good bargains. What have you to offer? 1-t.f.

Saw Mill

For sale on Muskoka Lakes, saw mill complete; daily capacity 20,000 feet. Good trade connection; plenty of timber available. Rare opportunity. Must be sold. Owner deceased. Terms reasonable. Box 418, Canada Lumberman, Toronto, Ont. 12-15

For Sale—Modern Saw Mill

and 300 Million feet of standing timber in British Columbia, most advantageously located on beautiful lake and main line of Transcontinental Railroad having advantage of $3 per thousand feet in freight rates to best markets on the Continent. Logging and manufacturing conditions ideal and very economical. A fortune for the right parties. Will sell on easy terms and may accept other desirable property in part payment. Principals only.

A. C. FROST COMPANY,
Corn Exchange Building,
14-17 Chicago, Illinois.

Demand for Lumber in France

France does not import large quantities of timber. During 1914 the value of imported timber was £1,709,625, an average of 3s. 10½d. per head. This is just 25 per cent. of the amount imported by Great Britain.

About 18 per cent. of the area of France is under forest, which is under the control of the Government, in order to prevent overcutting and maintain the production. The average quantity of timber cut per annum is 910,740,000 cubic feet, which added to the imports, shows an annual consumption per head of 27 cubic feet, about twice that of Great Britain.

A large quantity of this timber is used for railway ties; beech and oak are mostly used for this purpose, their average life being about twenty years. The annual requirements of the French railways are some 6,000,000, of which the majority—i.e., 5,500,000—are produced in the country.

There will be a big demand for timber of all sorts in France for reconstruction purposes immediately after the war, as although stone, brick and cement are produced at home, they will not be obtainable quickly enough for the immediate requirements.

A project has been announced by Le Batiment, a French building trades' publication, whereby a general federation, co-operating with the Government, is to be organized for the purpose of taking charge of the importation of all materials necessary for building and reconstruction enterprises, so that the building-up process in France may be facilitated and the resumption of normal economic life hastened.

The project recommends that the Government take an inventory of the resources that France now possesses in materials of all kinds, so that the organization may efficiently and quickly supply all needed materials. Under the general plan, materials for the reconstruction of the French railways and the building of railways in Morocco will be needed; also for rebuilding homes and factories; for the installation of machines and modern equipment of all kinds, and for the raw materials of manufacture.—Kelly's Monthly Trade Journal.

Pacific Coast Export Shipments For June

Pacific Coast export lumber shipments for the month of June totalled 22,513,387 feet, not including parcel shipments, according to the West Coast Lumbermen's Association. Fir figured in this to the extent of 18,026,135 feet, and redwood, 4,487,252 feet. In normal times with easy delivery at average rates, fir exports for the month of June would average better than 67,000,000 feet.

Review of Current Trade Conditions

Ontario

The most frequently discussed matter in connection with the lumber business in Ontario is the fact that the farmer, who is generally believed to have made a lot of money out of his crops last year, is not showing any readiness to part with it for lumber or building materials. The disappointing spring weather had much to do with this. Having spent so much time with his seeding, the farmer did little or nothing in the way of building, and. when the fine weather set in at last, he had passed the time of year when he likes to start building, or making repairs. It is not likely that the Ontario farmer will be a factor of any importance in the lumber trade for the balance of the present year. He will of course take a moderate amount of material and perhaps a little more than he did last year.

One of the interesting features of the trade to-day, though not one to be pleased about, is the way in which the market for hemlock has failed to take any interest in No. 2 stock. The small movement there is in hemlock is all in No. 1, of which stocks are not large, while No. 2 stocks are accumulating and are really making the manufacturers wonder whether they can be got rid of at all.

The demand for stock for shell box purposes continues strong. The latest contracts let by the Imperial Munitions Board call for large quantities of lumber and they are now well on the market. One hears on all sides, however, the continued complaint that the Board have got the prices down so low, by calling for tenders, that the production of shell boxes is a losing proposition for those who get contracts, and that the Board is likely to feel the effects of this in the way of unsatisfactory deliveries. Moreover, wholesalers and manufacturers who are selling stock to shell box manufacturers are frequently very dubious as to whether they will get their money out of it.

Most hardwoods are quiet but firm. There seems to be a general improvement in basswood, caused to some extent by a shortage of stocks. A lot of small mills which turned out stock last year have produced nothing this year on account of unsuitable weather conditions which prevented the logs from coming out. No. 3 common birch is practically off the market.

Eastern Canada

There is very little change to report in the lumber trade of New Brunswick, but there has been an important falling off in the cost of freight space for ocean shipment, during the last fortnight. Our latest advices tell of a drop of 125 shillings per standard. There has been no rush to secure space, however, as the demand in the English market has fallen off greatly. Coastwise freights have also come down, the decline amounting to about $1 per thousand feet. Stocks are not large and an improvement in the demand would probably stiffen up prices all round. The American market has steadied down to some extent and no longer shows the nervousness that prevailed a fortnight ago. Local trade at St. John is very quiet.

Building operations at Montreal are still on a small scale and the local lumber trade is quiet. The trade in hardwoods was active a short time ago, but has also become quiet. There is a fair amount of interest in B. C. lumber, especially Douglas fir. Trade with the United States is on a moderate scale only, and the same thing applies to that with Great Britain.

Business has been dragging to some extent in the spruce trade of Boston of late. Lower quotations have apparently made the retailers anxious, instead of tempting them to buy more extensively. The best quotations on frames are still held at $25 by large wholesalers. Random is in fair demand at the following range: 2 x 3, $20.50 to $21; 2 x 4, $21 to $21.50; 2 x 5 and 2 x 6, $20.50 to $21; 2 x 8, $24; 2 x 10, $25.50 to $26.50; 2 x 12, $26.50 to $27.50. Spruce boards are quiet and buyers are adopting a waiting policy. Hemlock at Boston has been affected to some extent by the reduction in the price of southern pine and by the altered quotations on spruce. Hemlock boards have been lowered a little bit by some dealers to meet the new situation. Hemlock planks are in better demand and steady. Shingles continue in good demand at Boston with prices firm, but there is a possibility that manufacturers will be catching up with their orders before long, and prices may ease off a little. Extra good white cedar extras are selling easily at $3.60.

United States

As forecasted in our issue of July 1st, a movement for curtailment of output has now developed throughout the Southern States and to a considerable extent also through the West Coast producing territory. Manufacturers in the west have found that the one way to avoid trade depression will be to cut down the output, and most of them have already commenced to do so. The same is true in the southern yellow pine districts. The trade situation in connection with southern pine shows some improvement, there being a better demand, with prices showing a tendency to stiffen. In some lines, such as dimension, prices have advanced 50c. per thousand feet. Other items are holding and are expected to do so as long as the manufacturers continue their curtailment policy.

The lumber trade of Chicago, which is generally a pretty good barometer of average trade conditions throughout the northern and western States, is not in so great volume as might have been expected, the result chiefly of unfavorable weather conditions. Lumber receipts at Chicago during the week ending June 24th amounted to 54,970,000 feet, as compared with 47,945,000 feet during the corresponding week of 1915. Shipments for the same week were 30,521,000 feet, an increase of 6,978,000 feet, as compared with the corresponding week of 1915. The total shipments from January to June 24, 1916, were 691,618,000 feet, an increase of 174,440,000 feet over the shipments during the corresponding period of 1915. The demand at Chicago for the upper grades of northern pine for pattern stock and other general factory use is greater than the supply, as dry stocks are scarce at most mill points.

The white pine trade at Buffalo is quiet. Weather conditions have been unfavorable for building work and the high prices of material and labor have been cutting down the volume of construction work. Prices are about steady.

The yellow pine situation is making itself felt in the form of pressure upon the hemlock market, and weakness is shown in this wood at some points. There is a fairly extensive movement of No. 1 hemlock boards at Chicago, and also a moderate movement of low grade stock, most of it being taken by the box factories. At Buffalo, the hemlock trade is as active as any other and the prices are steady. Wet weather has limited the demand from the country trade, but in the building business and other lines in the cities there is a little more activity than there was a year ago.

Hardwoods are rather quiet at Buffalo. Maple, oak, and ash are in fair demand, thick maple being in the lead. Prices are unchanged. Wholesalers are adding to their holdings and are expecting improvement in trade. There is also better feeling in the hardwood trade at Chicago. Thick stock in all northern hardwoods is moving well, particularly in birch.

Great Britain

The market at London continues fairly active. Rather large shipments of Canadian spruce are reported as having arrived, and importers are hoping for others in the near future. In connection with this trade it is encouraging to note in a recent issue of the Lumber Trades Journal, the following remarks: "It should be the duty of importers to do as much business as possible with our colonies and to instil into the minds of consumers the advantages of the freer use of colonial woods. We know that freights are still high from Canada, but this also applies to all lumber producing countries. It is unfortunate, however, that freights on spruce goods cost three or four times the value of the wood." Deliveries at London docks during the week ending June 10 amounted to 6,140 standards, as compared with 4,839 standards during the corresponding week of 1915.

On account of the temporary decline in freight rates for spruce shipments, c.i.f. prices at Liverpool have been a shade lower of late, but the result is simply to prevent other price advances for the time being. Spot prices are practically as firm as ever, £35 to £36 being paid for 3 x 11 in.; £33 to £34 for 3 x 9 in., and £31 to £32 for 3 x 7 in. Some merchants are looking for a little weakness in prices when the new season's arrivals make their presence felt upon the market, but if holders do not try to force matters, prices are not likely to drop. The slight concessions in the freight market are thought to be only temporary and not to warrant any modifications in prices in Great Britain.

At Manchester, prices continue high all around, with the single exception of spruce, which is a shade easier. Prices apparently depend pretty definitely upon the desires of ship owners. When they want money they are likely to reduce freight rates and spruce prices will become easier as a result, but when they are not in need of ready money they apparently will continue to take all the traffic will bear. At Glasgow, the trade continues on the quiet side. Buyers are not taking much interest in stocks, and owners are not showing any anxiety to dispose of them unless they get good prices. The temporary set back in freight rates seems to have had no effect on Glasgow spot values. A fair number of sales are reported in pine and spruce deals from shipments which have recently arrived, also a number of transactions in pine boards of the lower grades, all at very firm prices. The demand for pine still favors the lower grades almost exclusively.

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Trade—Ocean Freights Down

St. John, N.B., July 6th.—(Special to the Canada Lumberman).—The past two weeks have seen little change in the lumber business at St. John. In so far as shipments and local sales are concerned, the only change has been in foreign freights, which have eased off over 125 shillings per standard, and are still falling. Very little tonnage is being offered, but what is offered is not readily bid for, as was the case during the past twelve months, and if the boat wishes a charter very much the owners are forced to accept a much lower rate than at any time in the last year. Coastwise, the same effect is being felt. Schooners which were asking $5 to $6 to New York, are now taking $1 per M. less. The great reason for lower freights is the poor demand for lumber, the price of which in the English market has receded £5 to £6 per standard, with the demand growing less all the time. Stocks are not excessive, and if any business were offered no doubt prices would stiffen at once. This would cause shipping to be resumed and freights would continue to advance. The allies have not been buying timber to any extent during the last two months. Their demand has been a large factor in keeping freights and prices at the high pitch during the past month. If they should again come on the market it would have a tendency to harden prices.

No sales of any deals have taken place during the last two weeks and practically no shipments have gone forward. Upwards of ten million deals are piled on lighters awaiting shipment, and probably as many more are on the wharves at the mills, with plants still running, 5 mills sawing English deals and two American sizes.

The American market is no weaker than two weeks ago. If anything, it is steadier and the nervousness has subsided to some extent. The base price still remains at $25, Boston, and the tendency seems to be to stiffen. Many of the eastern mills which used to saw deals are closed, and the logs are going into pulp mills. The months we are now passing through are always hard ones, and when cooler weather comes along it usually brings a change for the better.

Local conditions are no better than some two weeks ago. The amount of building is being curtailed more and more, with no very good outlook ahead for the fall. Last year a fall crop of houses came on the market and helped to keep the factories busy all winter. Whether this will happen again this season cannot be told, but it is to be hoped it will be the case. Stocks of low grade lumber are excessive and are lower than some time ago. Spruce boards are not moving freely, either on rough or matched. Short lumber prices are firmer than long lumber.

Laths are worth about $2.75 on wharves at St. John. Shingles, so far as St. John is concerned, are in an independent position, for very few mills have any cedar logs to saw.

The box shook trade is very busy and has been the only trade which has not shown a falling off.

All the logs are now safe on the booms. Up to July 1st the Boom Co. had rafted out over 25,000,000 feet of logs. This is about one-half the logs in the booms. Plenty of late rains have kept the water up to a good pitch and driving has been finished a month earlier than usual.

Messrs. Murray & Gregory, Ltd., have just completed and started their new mill at Lac Frontiere, Que., where they have 6,000,000 of logs to manufacture before snow flies, besides a large quantity of pulp wood. This mill will saw about 50,000 feet per day, and is fitted with a fast feed rotary and all the best equipment for a modern mill.

B. C. Stocks Attracting Attention at Montreal

Montreal, July 10.—(Special to the Canada Lumberman).—With building operations still on a small scale, the local market is quiet. Apart from two or three theatres and a small number of schools and churches, building projects are of little importance. The additions to factories necessitated by munition orders are now about over, and contractors are relying for the main part of their work on residences, but even these are not as a rule of any size. There is a fair amount of building proceeding in the province, and this of course helps the volume of trade. The Montreal permits for the month of June were valued at $748,050, a decrease of $276,065, while for the half year the total was $2,434,344, a decline of $984,765.

Business in hardwoods, which was brisk for a considerable period, has now fallen off.

An inquiry for about 125,000,000 feet of lumber for French account—for the Government, it is stated—has been received here. Spruce, pine, B. C. fir, and various hardwoods are called for. The specifications include one random lot of over 26,000,000 feet.

Of late there has been a better demand for B. C. lumber, especially fir, the result of the publicity campaign of the Government and also of the increase in direct representation of B. C. lumber companies. Recently two or three wholesalers have been pushing the sale of B. C. woods.

Trade with the United States is moderate. More barges are available, but rates continue high.

A considerable amount of tonnage is again available for the United Kingdom. Owing to more grain being on offer, rates have a tendency to stiffen. Quotations were down to 250s. per standard, but have risen again to 300s. The fluctuations are also due to the quantity of space free from time to time, the arrival of boats being somewhat irregular.

Pulp and paper markets continue to boom. There is practically no sulphite on sale for near delivery, production having been nearly all sold for some time ahead. The Riordon Pulp and Paper Company are shipping a considerable quantity to the United Kingdom. It looks as if there will not be enough sulphite to go around when the usual fall demand sets in. Ground wood is also in active request.

Parrsboro Shipments Increasing

Parrsboro, N.S., July 5th.—(Special to the Canada Lumberman).—Lumbering news is rather scarce at present owing to the difficulty the shippers still find in obtaining bottoms. When the vessels now building are afloat, they will help to some extent, for it is understood that it is the intention of the builders to charter them for overseas. The largest one will probably be able to take two cargoes this season, and possibly some of the others will do the same.

The steamer Manchester Civilian, Capt. Spencer, which sailed from this port recently for "Somewhere in France," took a cargo of 4,225,825 feet (2,134 standards) of spruce and hemlock deals and scantling. This was the largest lumber cargo ever shipped from Parrsboro. The freight amounted to the tidy sum of $207,000.

The Parrsboro tern schooner Lilian H., launched at Port Graville last April, has been chartered to load deals here for Europe at 400 shillings per standard. She took a cargo of piling from Port Graville to New York, and from there brought hard coal to St. John, N.B., thence returning to Parrsboro. Several other large schooners are due to load deals here shortly, and another big steamer is expected to load here in July.

Shipbuilding all along the Parrsboro shore is being pushed rapidly.

Parrsboro Export Trade Active

Parrsboro, N.S., July 5.—(Special to the Canada Lumberman).—The new tern schooner Lillian H., cleared to-day for Newport, England, with 530,000 feet of spruce and hardwood deals and scantling.

A Norwegian steamer arrived to-day to load deals for the United Kingdom.

The tern schooner Exilda, which made four successful trans-Atlantic voyages from this port last season, arrived at Preston, England, this week with her first cargo of deals for this year.

Two tern schooners are loading lumber here at present—one for the United Kingdom and one for the United States. Three other three-masters are chartered to load here at once for Great Britain at about 360 shillings per standard. The schooner which cleared to-day had 400 shillings, which is probably the record, as the recent heavy slump in the English market is undoubtedly affecting freights. Two of the chartered schooners are in port and the other is due to arrive. It is probable that the lumber business will be pretty brisk here for a few weeks, for, in addition to the bottoms already mentioned, another steamer is on the passage to this port, and at least one more is chartered for early loading.

The shipbuilders along shore are pushing their work as fast as scarcity of shipwrights and unfavorable weather will permit. Nearly all of them have announced that they will commence larger vessels as soon as those now on the stocks are completed. Their present intentions, however, may be changed by future conditions.

North Shore Lumbering Conditions

Thessalon, Ont., July 4, 1916.—(Special to the Canada Lumberman).—The drives are about completed for the season and we have had the most favorable weather for driving that has ever been experienced in Algoma. There was rain nearly all the time and the water in the rivers and creeks held out so that operators were able to do the driving with a smaller force of men than formerly. Although

supplies were more expensive than usual the drives have come out quickly and therefore at a reasonable cost.

The largest deal that has been put through on the North Shore for some years was closed recently when the firm of White, Gratwick & Mitchell, of Buffalo and Tonawanda, N.Y., purchased the entire holdings of the Hope Lumber Company of Thessalon, Ont. The purchasers acquired 200,000,000 feet of the finest white pine timber in Algoma, together with the sawmill and the whole plant of the Hope Lumber Company as a going concern. Mr. Carney, the new manager, has just arrived in Thessalon and will be general superintendent of the whole business, being assisted by Mr. Charles Williams, formerly of Spanish River.

Mr. H. H. Bishop, of the Thessalon Lumber Company, arrived in Thessalon a few days ago and reports that the company have all their lumber sold. Their work this summer will consist simply of sawing the stock and making shipment. In discussing the outlook for the present season, Mr. Bishop was rather guarded, not feeling inclined to give any definite information. Labor, he believes, will be very scarce, and he expects that wages in the woods will be high when the logging season commences.—Algoma.

The Spruce Market at Liverpool

In a discussion of the market situation for spruce at Liverpool, the "Timber Trades Journal" of London, England, in its issue of June 17th, refers to the subject as follows: "During the past week the c.i.f. market, for lower port spruce, has lost some of the firmness that has characterized it for such a considerable time, and the weaker tendency that prevails, whether of short duration or not, is both sudden, and, except among a few importers, unexpected. Allusion has been made to the uneasiness that appeared to be displayed by many consumers and merchants, who were of the opinion that the falling off in freights was the beginning of a slump in spruce, but at the same time it is impossible to say whether the freight situation, as seen to-day, is really responsible, in itself, for the sluggish feeling in the trade at present existing.

"True, tonnage rates are down, and, reflecting the weakness in grain, etc., they may yet recede further, but the lower steamer fixtures are for prompt voyages, and so far do not apply to later shipments; so that the present position may be no criterion even of the near future, although, with the more definite control of British tonnage, the likelihood is that neutral boats will be seriously affected.

"A further setback in freights may not, however, mean correspondingly lower spruce prices, as the highest c.i.f. figure recorded this season does not permit of the highest freight paid, and the possibilities are that the bulk of the shippers' cargoes already chartered for are now disposed of. Further, though additional chartering is sure to take place, it is likely not to be to a large extent; as it is understood the tonnage shortage of some weeks ago does not to-day exist, in view of the f.o.b. business which has taken place, and for which the Government transports will be utilized.

"Whilst the freight outlook has played some part in shaking the importer's opinion of the future, to make it entirely responsible is misleading. A more reasonable cause is that the weakening is due to sympathy with the Swedish position; and in the fact that among the first arrivals from the lower ports were a few unsold cargoes. Coming as they did on the top of an easy tonnage market, despondency was quickly brought about, and unless the unforeseen happens, a better state of affairs can still transpire. Heavier arrivals must be expected at this time of the year, but, allowing for all, shipments may yet be well short of anticipations."

Boston Trade Slacking Off

A Boston firm of wholesalers advises us under recent date, as follows: white pine in the barn board grade seems to be firm. The spruce list is almost all weaker. There seems to be a let-up in buying just now. There were a great many embargoes in force during the winter and some people bought and kept on buying because they could not get what they bought. Finally they have gotten the lumber in and it seems to have overstocked them, and there has been rather a general hold-up in buying. We think the yards are doing a fair trade, some of them a very good trade. There is a little trouble through New England in certain localities with strikes. Altogether the edge seems to be off the boom. However, we have little doubt but there will be a strong trade again by fall. N. C. pine has been the weakest thing and the low grades of box and roofers have very materially fallen off. White pine box, on the other hand, seems to be fairly firm and not over and above plenty.

Market for Shooks in Greece

There is a sharp demand in the Patras market for shooks used in making currant cases. The size chiefly used for exporting currants is known as the quarter case. The inside measurements of the quarter case are: Length, 18½ inches (47 centimetres); wodth, 9½ inches (24 centimetres); depth, 9 inches (23 centimetres). The pieces for the sides of the case should be two-fifths inch thick; those for the

ends, five-eighths inch. The ends are set in. They should always be of one piece, as the stability of the case depends largely upon the ends. The top should also be of one piece. At least one side should be of one piece. The kind of wood to be used is especially important. It should be odorless. Such woods as pine have a resinous odor which attaches to the currants and damages them. The material should be of light weight and fairly tough. Spruce is probably best adapted for this use. The annual consumption of quarter cases on this market is about 2,000,000. Local firms are now beginning to place their orders in the United States against the opening of the currant season, August 23, 1916. Quotations should be per case, and if possible c.i.f. Patras or Piraeus, Greece; they may be f.o.b. New York. Shooks should be bound in small parcels. American firms are especially invited to send to Patras, by parcel post, samples of the woods they offer for the benefit of local dealers. The latter are not yet well acquainted with American woods, and some of the woods that have been imported did not prove entirely satisfactory.—United States Consul A. B. Cooke, Patras.

Quebec Cullers' Report

The following comparative statement of timber, measured and culled to date, is furnished by the Supervisor of Cullers' office, Quebec, P.Q., under date of July 7th:—

	1914 Cubic ft.	1915 Cubic ft.	1916 Cubic ft.
Waney White Pine	384,240	139,240	16,680
Oak	184,320	78,160	167,560
Elm	253,200	46,840	58,880
Ash	600	480	240
Birch and Maple	50,800	42,240	46,880

Barbados Market Report

S. P. Musson, Son and Company, Bridgetown, Barbados, report under date of June 8th, as follows:—Lumberstuffs—White pine—The position is the same as last advised. No arrivals have taken place during the fortnight, and we can recommend further shipments, which would sell to advantage. Spruce—We note the arrival of a small lot of 56 m. ft. by the Schr. "Gladys & Lillian" from Lunenburg, which was purchased by an exporter at the net round price of $29 bond. Locally, supplies are still wanted, as no receipts have come to hand. Shingles—We understand that during the fortnight a cargo of about three million cedar laying has been placed to arrive, at $2.82 for Extra No. 1's and $2.32 for No. 1's. There is also some enquiry at present for Long Gaspe. Shooks and wood hoops—No arrivals to note.

Taxing Lumber Off the Face of the Earth

In an address before the Federal Trade Commission of the United States, one of the counsel for the National Lumber Manufacturers' Association made the following remarks about the Pacific Coast lumber industry, recently:—

"A factor of greatest significance is the geographical location of the industry as related to the markets. The freight to the markets of greatest consumption generally equals, and often exceeds, the value of the manufactured product. The rail haul to the competitive markets approximates 2,000 miles.

"The local trade consumes about three-fifths of the entire production. The entire production in the States of Oregon and Washington annually during a normal year is 5,600,000,000, or nearly 6,000,000,000 feet. In round numbers the State of Washington will produce about 4,000,000,000 and the State of Oregon about 2,000,000,000.

"Common building grades of lumber, such as boards, shiplap, and dimension, are sold at the mills to-day at from $6 to $8. The consumer in the east, on the other hand, pays anywhere from $22 to $30, depending on the keenness of competition, and where it is located.

"To the north lies British Columbia, manufacturing in competition the same commodity. The industry there enjoys the aid of the Government. We can rest assured that when peace comes, greater and more substantial aids will be given the Canadian operators.

"The tax element is a prime influence in the urge of over-production. The average value in fourteen counties in which one company owns land in tracts varying from 5,000 to 30,000 acres, is $26 an acre, and that is the assessed valuation, and on that basis the average tax for the year 1913 was $1.119 per acre. That is a little over 2 cents per thousand on the county cruises.

"Outside of those averages in one county they have taxed it so high that the taxes per annum amount to as high as $6 per acre, and the consequence is that while we have been holding our timber for years this company felt it was confiscation if held much longer, and consequently, between Everett and Seattle, along the line of the Interurban Railway, you will see a barren country logged off in the last five years, and the company is going to continue in this county until there is nothing left but the land, and will sell that for what they can get for it."

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Present and Future of Prairie Trade

By H. Finger, of Finger Lumber Co., The Pas, Man.

Probably no industry in Canada has suffered more from the effects of the war than the lumber industry. While the war has been the means of a rapid increase in the prices of commodities such as food stuff, iron, clothing, etc., lumber has not been so favored. The few advances that have taken place since last fall have not as yet placed lumber at normal value.

The export business of British Columbia has not yet attained the activity hoped for. The demand from foreign countries is there, but the manufacturers have been unable to secure sufficient ship space to load. The B. C. mills have, therefore, been compelled to look to the Prairie Provinces for the marketing of their lumber. This active competition of the B. C. mills is considered an important factor in the tendency to keep the price of our native product, spruce, down to almost unprofitable level.

During the summer of 1915 the lumber market was in a demoralized state. The big crop harvested in Manitoba, Saskatchewan, and Alberta changed the situation somewhat, and during the latter part of the year there was a real old-time demand for lumber and prices actually went up a notch. The spruce manufacturers were hopeful that at last a change for the better had taken place and as the stocks at all the mills were very low and badly broken in grade and sizes, they prepared for a rather heavy output of logs. I am not in possession of reliable statistics as to the extent of last winter's logging, but I believe I am safe in placing the output of Northern Manitoba and Saskatchewan spruce at 110,000,000 feet. The logging was favored with good weather conditions, but at times operations were handicapped by heavy snowfall. Men were fairly plentiful, but certain restlessness was noticed among them at times and wages had a tendency to advance. The scale of wages ranged from $15.00 to $45.00 per month.

All the drives have been successfully brought to the mills and sawing operations commenced under favorable conditions. All the mills are preparing for a big cut, running night and day.

Lately there has been a noticeable falling off in demand, but prices still remain firm, and it is not considered that the decline is caused by any real stagnation of business in the Prairie Provinces. Weather conditions throughout the Middle West have been very unfavorable for building and heavy rains have delayed seeding to a certain extent. As soon as weather conditions improve, it is certain there will be a very active demand for lumber. This demand is bound to increase as soon as peace is established in Europe. Tremendous quantities of lumber will be needed in European countries that have been devastated by the war, in reconstruction, and as soon as the mills at the seaboard, both Atlantic and Pacific, can obtain bottoms to load, the pressure in the domestic market will be relieved. It is also quite certain in my mind that with the approach of normal conditions, public, private and railway construction will be resumed with renewed activity. There are so many needed repairs, so many needed public buildings, so many needed new railway lines, the construction of which have been postponed during the last four years for better times, that as soon as the sword is sheathed in Europe there is bound to be a rush in construction all over this western country. I am, therefore, hopeful that next year will place lumber at a value that will insure the manufacturer a reasonable profit so as to recompense him for the loss, worry and strain to which he has been submitted the last four or five years.

In conclusion, I wish to say that I believe it would benefit the trade generally if a closer relation existed between the retailer and the manufacturer. Their interests are common; what benefits one, benefits the other. The manufacturer should study the retailer's requirements and fill the orders promptly as called for, but if the manufacturer finds he must make an extra charge for special working, I do not believe the retailer should kick. It also seems to me the retailers are at times somewhat unreasonable in demanding "prompt shipment or cancellation." The capacity of a mill's shipping department is just so much and beyond that it cannot be increased, and it seems unfair that one reailer should demand that his order have preference over others. Retailers do not always seem to remember there is such a thing as car shortage, which particularly makes itself felt during the season when the grain is being moved. Crowding the orders could be prevented if the retailers could be induced to place orders ahead and carry sufficient stock of the items for which there is continual demand.

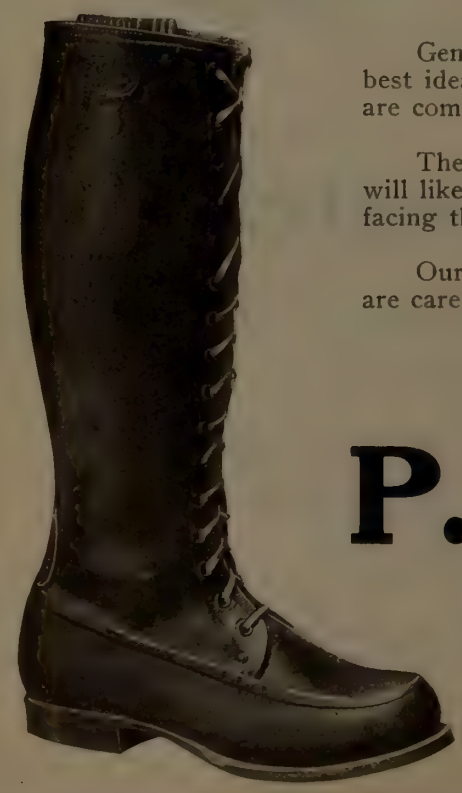
Reports recently received from railroad officials in Montreal state that the shipment of B. C. timber and forest products to Eastern Canada during the past month or two have been about three times their normal quantity.

R. N. Duff, of the firm of Duff and Stewart, lumber manufacturers and dealers, Bluevale, Ont., died recently after a severe illness of many weeks, following a stroke of paralysis.

GENDRON
SHOE PACKS

THE P.T. GENDRON SHOE PACK CO. MIDLAND GENDRON MIDLAND ONT. CAN.

Made in Canada



Gendron Genuine Draw String Shoe Packs embody the latest and best ideas of manufacture. They wear, they keep the feet dry, they are comfortable under all conditions. These are the main points.

The price is reasonable. The value is away above the price. You will like these shoe packs if you try them. Hundreds of lumbermen facing the same conditions as you, are enthusiastic about them.

Our manufacturing process is thorough from start to finish. We are careful with every pair.

Send for our catalogue and prices.

Why An Aloxite Saw Gumming Wheel Cuts Cool

ALOXITE is tough—it has just the proper temper to keep the wheel with a free cutting face.—The wheels are of an open or porous nature, thus allowing the free action of the grain. —A close bonded wheel drags—creates friction—friction means heat. Aloxite wheels cut cool, free, fast—they don't fill—they produce no unnecessary friction—they work without rasp or screech—hold their shape—show long life.

EDGINGS

Ontario

F. C. Smith, Harrow, Ont., recently suffered a serious loss by fire. The amount of the loss is estimated at $8,000.

A few piles of lumber in the yard of the Colonial Lumber Company, Pembroke, Ont., were recently destroyed by fire. The loss is covered by insurance.

The Thessalon Lumber Company, Nesterville, Ont., report that they have disposed of their whole stock of lumber to be sawed during the present season.

J. Dent, Dutton, Ont., is contemplating the erection of a new sawmill and barns at a cost of $4,000, to take the place of the ones that were recently destroyed by fire.

The Northumberland Paper & Electric Company, Campbellford, Ont., have commenced work on the rebuilding of their paper mills, which were recently destroyed by fire, at a cost of $60,000.

C. F. Smith, Harrow, Ont., whose planing mill was recently destroyed by fire, will rebuild the mill as soon as possible. The new plant will cost about $10,000 and will be equipped with electrically operated machinery.

The sawmill and barns belonging to J. Dent, of Dutton, Ont., were destroyed by fire recently. The sawmill was a portable one, placed in a building adjoining the barn. The cause is unknown. The loss may exceed $3,000, and there was no insurance.

The Hugh Munro Lumber Co., Ltd., has been incorporated, with head office at Toronto, Ont., and capital stock of $40,000, to carry on business as manufacturers and dealers in timber, lumber and wood products. Those interested are Hugh Munro, J. Munro, and A. Munro, all of Toronto.

The Sangeen River recently rose very rapidly as a result of heavy rain fall, and caused a lot of damage, one of the sufferers being A. Dawson, who operated a sawmill on the river at Chesley, Ont. Several dams were carried away and Mr. Dawson's logs were swept away, involving a loss of about $3,000.

The hardwood plant of Dominion Hardwoods, Limited, Deseronto, Ont., manufacturers of woodenware, was totally destroyed by fire on July 9th. The company was a new one, which had recently commenced operations and had a large quantity of orders on hand. The loss is estimated at $100,000, which was partially covered by insurance. The company expect to rebuild immediately.

White, Gratwick & Mitchell, of Buffalo and Tonawanda, N.Y., have purchased the entire holdings of the Hope Lumber Company, of Thessalon, Ont., including 200,000,000 feet of the finest white pine in Algoma, together with the company's sawmill at Thessalon. The new manager of the business will be Mr. Carney, and he will be assisted by Mr. Charles Williams, formerly of Spanish River.

Eastern Canada

F. H. Stearns & Company, wholesale lumber merchants, Montreal, P.Q., have been registered.

J. A. Bourassa & Cie., Shawinigan Falls, P.Q., have been registered. Those interested are Harvey E. Howe and Jos. A. Bourassa.

Theodore Groleau & Fils, timber contractors, St. Thecle, P.Q., have been registered. Those interested are Arthur Groleau and Josephat Groleau.

Frederic Talbot, St. Lucien, P.Q., recently lost his sawmill by fire. The amount of the loss is not stated, but it is probable that it was covered by insurance.

The sawmill belonging to J. W. and J. Anderson, Burnt Church River, Northumberland County, N.B., was recently destroyed by fire. There was no insurance.

Wm. M. Sullivan, Nelson, N.B., has not yet drawn up definite plans for the sawmill which he intends to build this year, but reports that it will be a band mill and will probably cost between $35,000 and $40,000.

The International Land & Lumber Company, Ltd., are preparing plans for the erection of a pulp mill near St. Valician, P.Q., to cost about $200,000. The secretary of the company is S. A. Huntington, 285 Bank Street, Ottawa, Ont.

The River Valley Lumber Company, of Oromocto, N.B., recently paid $300 per square mile for a timber berth of 4½ square miles on Bear Brook, a branch of Little River, in Sunbury County, the berth being offered at a public auction.

The Richelieu Industrial Company, Limited, has been incorporated, with capital stock of $45,000 and head office at Montreal, to carry on business as lumbermen. Among the incorporators are S. Lavery, Advocate, of Longueuil, P.Q., and T. Robillard, Bailiff, of Montreal.

Traversy, Limited, have been incorporated with capital stock of $100,000 and head office at Montreal, to manufacture and deal in all kinds of timber,

lumber logs, etc. Among those interested are V. T. Traversy and V. I. Traversy, mill owners and manufacturers, of Westmount, P.Q.

La des Bois du Nord Cie, lumbermen, Montreal, P.Q., have been registered. The chief party interested is Jean P. Chevassu.

The Holjohn Company, Ltd., has been incorporated with head office at Montreal, P.Q., and capital stock of $49,000 to carry on business as manufacturers and dealers in logs, lumber, timber wood, etc. Those interested are E. W. Howard, J. DeWitt, H. E. A. Rose, and H, C, McNeil, all of Montreal,

Bras d'Or Coal Company, Ltd., has been incorporated with head office at Montreal, P.Q., and capital stock of $45,000, to carry on business, among other things, as manufacturers and dealers in timber, lumber, logs, etc. Those interested are H. A. Lovett, G. W. Cole, N. Sheach, B, F, Fowler, and P, F, Brown, of Montreal,

Murray and Gregory, Limited, St. John, N.B., have completed their new mill at Lac Frontiere, P.Q., and have commenced operations at that point. They have a stock of 6,000,000 logs on hand for this mill and will saw it before the winter. The mill is equipped with a fast feed rotary and other modern machinery and will turn out about 50,000 feet per day.

The Cushing mill at Union Point, N.B., owned by the Edward Partington Pulp & Paper Company, was completely destroyed by fire recently. The loss amounted to $25,000 and there was no insurance. The fire broke out in the little mill and quickly spread through the sawmill to which it was confined. This mill was built by the Andre Cushing Company, at an original cost of $120,000, and was one of the finest on the St. John River. After being taken over by the Partington people the machinery was sold and the building had been used largely as a storeroom.

Price Bros. and Co., Limited, Kenogami, P.Q., have secured funds for additions to their news print and pulpwood mills. It is expected that the new news print unit will be in operation by February next year, bringing up the total output to 62,000 tons per annum. October 1st next is the date fixed for the completion of the ground wood and sulphite additions. The production of the former pulp mill will be increased to 55,000 tons per annum and the latter to 25,000 tons. Half a million dollars have been secured by the sale of 6 per cent. collateral trust notes, secured on the development of the Shipshaw Power Company, which supplies power to Kenogami mills.

The St. Maurice Lumber Company, Three Rivers, P.Q., have constructed a telephone line on their Mekinak Limits for a distance of 15 miles through the forest. The line runs from their Middle River headquarters on the National Transcontinental Railway, where they receive their provisions and supplies for logging operations, to the mouth of the Brochet River, where the logs are placed in pocket booms to be towed across Lake Mekinak by a tug, and from Brochet River the telephone line continues to Lake Mekinak dam at a point where the logs are sluiced into the Mekinak River and driven for a distance of seventeen miles to the main St. Maurice River, twenty-one miles above Grandes Piles. This telephone line is a great convenience both for their logging and driving operations. It is their intention now to have lines to the different streams that run into Lake Mekinak. This facility of telephone communication will be a safeguard against forest fires, as well as a convenience in their operating works.

Western Canada

The Capilano Cedar Company, Limited, has been incorporated with capital stock of $10,000 and head office at Voncouver, B.C.

The Roy & Moffatt Logging Company, Limited, has been incorporated with capital stock of $10,000, and head office at Vancouver, B.C.

The Hammond Cedar Company, Limited, has been incorporated, with capital stock of $40,000, and head office at New Westminster, B.C.

The Colonial Lumber and Paper Mills, Standard Bank Building, Vancouver, B.C., are clearing the site for paper and pulp mills which they will erect at Quatsino, B.C.

The Ross Saskatoon Iumber Company, Waldo, B.C., are arranging to make a number of repairs to their sawmill which was damaged by recent floods. The repairs will include the installation of new machinery.

C. L. Wiley, Seattle, Wash., has purchased 3,400 acres of timber on Clear Water Creek and will erect a shingle mill near Nelson, B. C. About 40 men will be employed in the camps and mill. A shingle dry kiln will also be erected in connection with the plant. Mr. D. C. Wiley, a son of Mr. C. L, Wiley, will be in charge of the operations.

Sealed tenders are being received by the Minister of Lands for B. C., until July 26th, for the purchase of license X 90, to cut 7,130,000 feet of Douglas fir, hemlock, cedar, white pine, and balsam fir and 535 cords of shingle bolts, on an area adjoining lot 115, Sydney Bay, Coast district, Range 1. Three years will be allowed for the removal of the timber.

The Western Canada Timber Company will resume operations at its mill at Gerrard, B.C., this month. Mr. J. Fred Robinson, manager of the company, has let a contract for taking out 10,000,000 feet of logs from the company's limits on the Lardeau. The company have about 4,000,000 feet of logs on hand. They will employ about 50 men in the mill and 40 in the camps. The mill has a capacity of 75,000 feet a day. The company's mill at Summit Lake is running regularly, employing about 45 men at the plant and in the logging camps and turning out about 35,000 feet a day. Mr. Robinson has made an arrangement with a Calgary firm to handle the entire output of the company's plants.

"Maple Leaf" Brand

Stitched Cotton Duck Belting

A trial Belt will convince you. Write for prices and samples.

Excels all others in economy, strength, efficiency and true running, whether for transmission of power or conveying. A test recently made at McGill University, Montreal, of a 6-ply **"Maple Leaf"** belt, a light double leather, and a 6-ply rubber belt, showed that our **"Maple Leaf"** Belt stood a breaking strain 50 per cent. greater than the leather, and 25 per cent. greater than the rubber belt.

This Valuable Book sent all Belt Users for the asking

THE BELTING MANUAL, a hand book of 96 pages, substantially bound, is the most complete and concise book published on belt transmission. It tells

—how to select belting.
—how to install, lace and care for belting.
—how to make belting endless on the pulleys.
—how to find the width, speed and horse-power of belting.
—scores of other "hows" which are constantly coming up in your Power Transmission problems.

We want to send a copy of this book to every Mill Manager, Superintendent, Purchasing Agent, Foreman, Master Mechanic, Engineer or others who are actually responsible for the selection, installation and up-keep of belting equipment.

If you haven't a Belting Manual write us on your business stationery and a copy will be sent by return mail.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa, Deputy Minister.
December 20th, 1912.

Logging Harness

Harness for Lumber Camps has to stand an extraordinary amount of strain under most trying conditions.

For this reason special attention has to be paid to it, in the making, in order to produce a product to last and give good service.

In making Alligator Brand Lumber Harness we use the best leather selection and finest manual skill possible. Our fifty years of knowing how is ample assurance that Alligator Brand harness is best

For Lumbermen

The illustration shows one of our lines of Truck Harness. For heavy wear—continuous service—and lasting qualities, this model would be hard to equal. Strength characterizes the complete outfit. Weight about 100 lbs.

We have a handsome illustrated catalogue describing a model just suited to your requirements.

Send for your copy today.

"I Call That a Perfect Match"

MONTHS, or even years from now, when your most particular and perhaps best paying customer calls on you to match the job of moulding you are running for him to-day, will you be able to fill his order according to specifications—not *approximately* "like sample," but ABSOLUTELY? Will he be able to place a piece from the new run up alongside the old and say, "That's a perfect match?" The chances are against you unless you have installed one of the

Yates - formerly BERLIN

Fast Feed Moulders

Equipped with Mill-to-Pattern Bits

Write for Free Book "Heads and Specialties"

Mouldings run to day may be matched ten years from now to the one one-thousandth part of an inch with no additional bit expense other than re-grinding. Compared to old and laborious processes of forming bits by hand, the cost of milled-to-pattern bits is negligible. The pattern of the milled bit extends its entire length and cannot be changed by wear or grinding.

Being exactly identical in form and all jointed to a perfect cutting circle on the machine at top speed, each of the six bits in the slip-on profile head does its own share of the cutting. This means fast feeds and perfect work with non-productive time cut to the limit.

Complete data covering all Yates Moulders so equipped awaits your investigation.

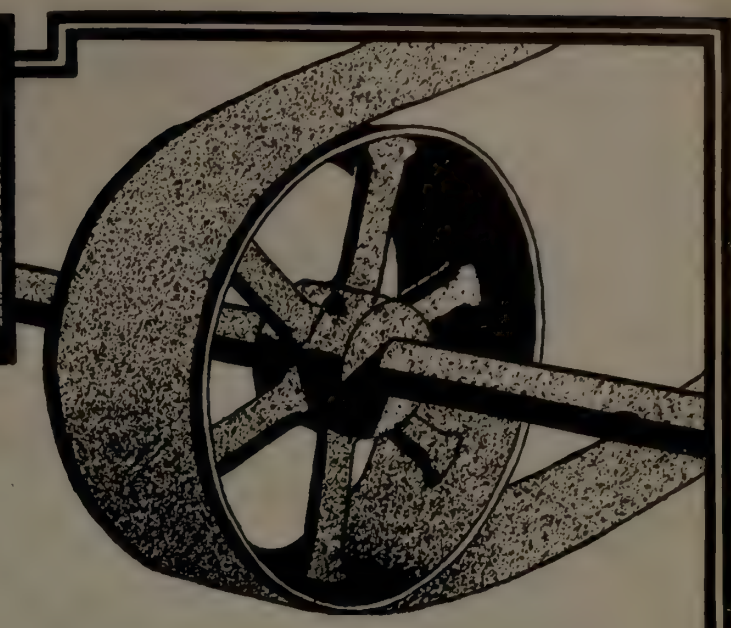
When You Overhaul Install

GOODHUE BELTS



"Acme Waterproof" Leather Belting

This brand is especially well suited to the wet places in a saw or pulp mill and will run true as long as it is in service. When you are overhauling your mill equip it with "Goodhue Belts" and you will never regret it. They are honestly made of solid leather—every inch a good belt and they won't stretch.

Don't Blame the

FIRE BRICK

if it fails to give satisfaction. More likely than not you have been using the wrong kind for your particular purpose. A firebrick intended for use in a small hand-fired boiler may not give the same result if used under high pressure boiler with mechanical stoker.

So when sending us your enquiries be sure to specify for what purpose these brick are to be used.

You are sure then of a high quality brick, that is absolutely the best for your purpose.

We Manufacture the Following Well Known Brands

"Elkco," "Elk Steel," "St Marys," "Keystone" and "Rotex"

Catalogue is yours for the asking.

ATKINS
BAND and RE-SAWS

We have achieved an enviable reputation for supplying SAWS which stand up to their work longer, with less re-fitting than any other SAWS in the world. If there is any doubt in your mind, we stand ready to prove it to you.

A Perfect Saw for Every Purpose

Send for our 248 page book on Saws. The most valuable and interesting Saw book ever published. Tells you just what you want to know about SAWS, MACHINE KNIVES and SAW FITTING TOOLS.

Grooves Cut with Huther Bros. Dado Heads

Fits Any Saw Mandrel

A Huther Bros. Dado Head consists of two outside cutters and enough inside cutters to make the required cut. This Head will cut perfect grooves, with or across grain, any width. It is an easy Head to keep in perfect condition, has a simple quick adjustment, and may be enlarged any time after purchase. Sent on approval and if not satisfactory return at our expense.

ROCHESTER, N. Y.

INDUSTRIAL LOCOMOTIVES

A locomotive to justify its cost must start the required load and keep it going.

The right amount of the right material must be provided in the right place.

Each and every part must be sure to fit not only the locomotive for which it was made, but every other locomotive of the same size and design. Spare parts must be instantly available, made so well as to go into place without a machine shop.

We have a number of standard sizes of locomotives in stock and can make immediate delivery.

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

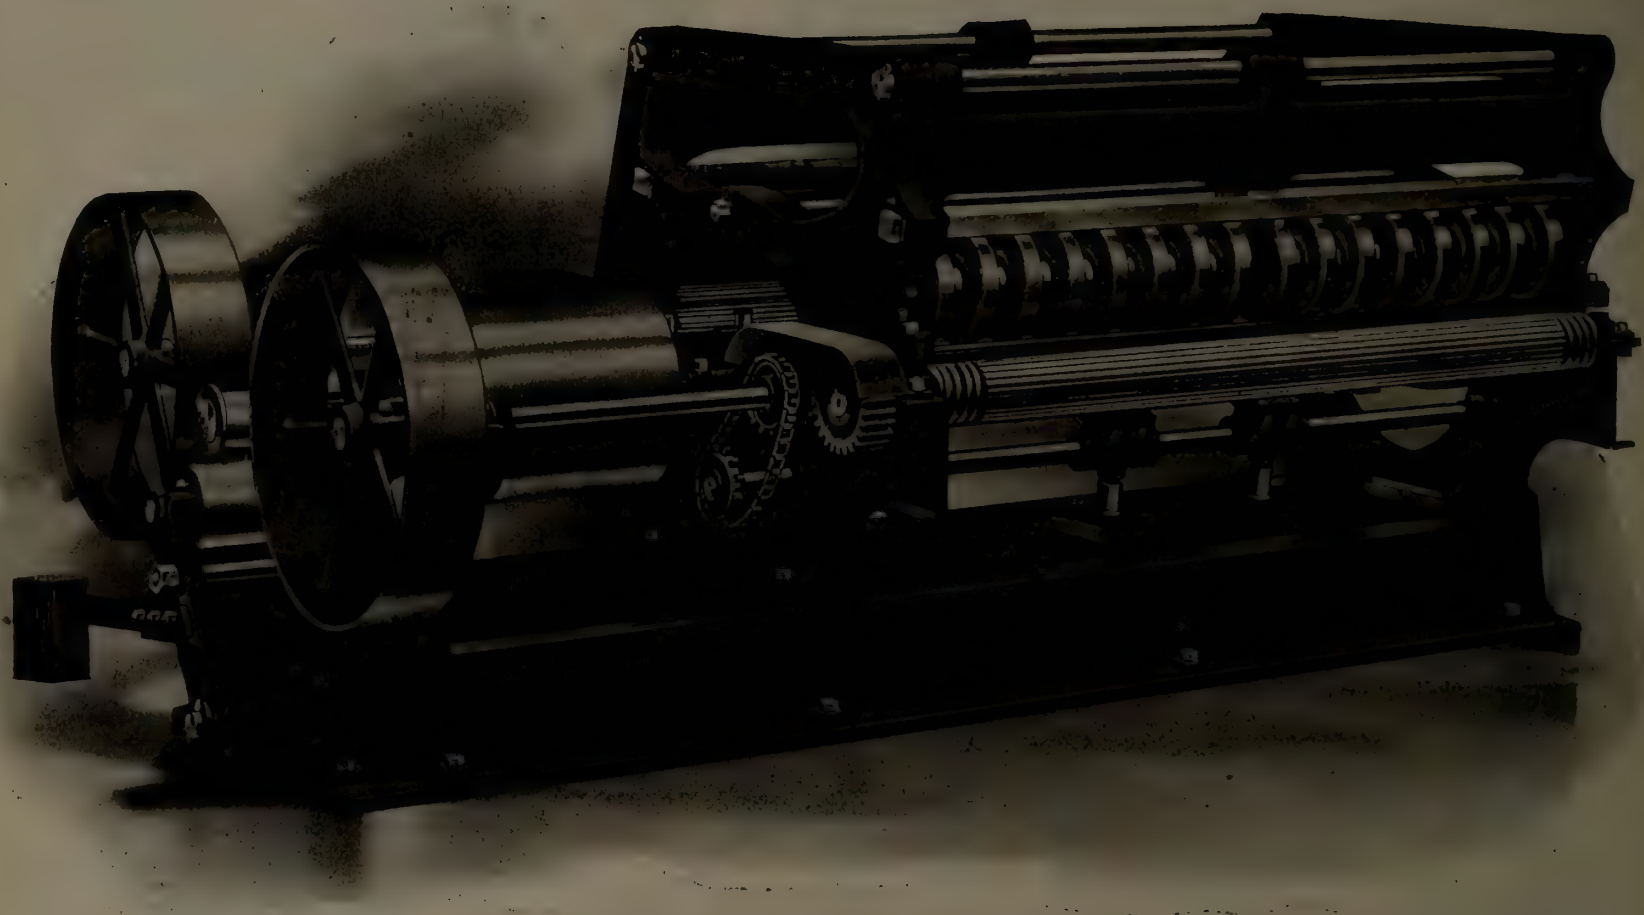
CLIMAX Improved Geared LOCOMOTIVES FOR WOOD AND IRON RAILS

A 62-ton Climax Locomotive Designed Especially for Heavy Logging Work.

Climax Locomotives are successfully operated on steep grades and sharp curves. Any weight or gauge. Locomotives in stock for immediate shipment. **Get Catalog "H."**

CLIMAX MANUFACTURING CO., 313 W. Main Street, CORRY, PA.
VANCOUVER MACHINERY DEPOT, LTD., VANCOUVER, B.C.

Heavy Duty Edger



These sturdy, heavy duty edgers are built in sizes of 48 inch, 54 inch, 60 inch, 66 inch, 72 inch and 84 inch.

A feature in the construction of these machines is the casting of the base in one piece. This makes the machine self-contained and always in alignment.

We will be pleased to send you bulletin describing these edgers and giving their specifications.

The E. Long Manufacturing Company, Limited

Orillia - Ontario

Some Waterous Bandmill Advantages

1.—It is built in 8, 9 and 10 ft. sizes—one for every kind of work.

2.—The spring-cushioned, all knife-edged tension device is the most sensitive in use.

3.—Upper and lower guides swing about the exact centre of the saw blade.

4.—The upper guide is raised and lowered by steam, an accurate, easy and swift adjustment unequalled by any other.

5.—Wheel raising device and tilting device are roller bearing.

6.—All operating mechanism is enclosed within the columns—sawdust and slivers cannot reach it.

7.—Massive design of bed and columns precludes vibration during cutting. This mill is absolutely steady doing the heaviest work.

8.—Mandrel bearings, both upper and lower, are easily adjustable and align rapidly and accurately.

9.—Every part of the mill is designed to make millwrighting easy and adjustments and inspections can be made without difficulty.

10.—Waterous Band Mills are designed and built in a plant that has specialized in the manufacture of Canadian sawmill machinery for more than seventy years.

Ever See This Mill at Work?

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. **Price 30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

"AMPHIBIA"

BELTING

For Difficult Runs

The supreme test—the acid test of belting is on heavy duty machines, over high-speed small pulleys. AMPHIBIA Belting on these runs, as shown above, makes you forget belting troubles, because no trouble develops. The wear is there under all conditions.

Prove it. Try a sample of AMPHIBIA Planer and see for yourself.

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 8-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Parry Sound Lumber Co., Limited, 26 Ernest Ave. Toronto, Can.

ARKANSAS SOFT PINE
TRADE MARK

Not Only

WHITE ENAMEL

But

STAINED and VARNISHED FINISHES

As Well Can Be Successfully Carried Out On

ARKANSAS SOFT PINE

Being a practically non-resinous wood in the finish grades, it is not necessary to shellac the raw surface, but instead the chosen stain of whatever color is applied **FIRST,** insuring a perfectly uniform absorption. Shellacs and varnishes are then applied and rubbed down.

We urgently recommend machine sanding as against hand work on the bench. All finish should be so worked wherever possible. This treatment in combination with the above method of final application insures a beautiful satin-like surface to the completed work.

Arkansas Soft Pine is properly suitable for woodwork in fine residences, apartments, churches and offices. It is being **NATIONALLY ADVERTISED.** It is identified by a registered trade mark. Its manufacturers **STAND BEHIND IT.**

What better selling arguments could you put to your trade, Mr. Dealer? Better let us quote on your next car.

All stock bearing the Arkansas Soft Pine Trade Mark is manufactured and sold exclusively by the following companies:

Crossett Lumber Company, Crossett, Ark.
Eagle Lumber Company, Eagle Mills, Ark.
Edgar Lumber Company, Wesson, Ark.
Freeman-Smith Lumber Company, Millville, Ark.
Fordyce Lumber Company, Fordyce, Ark.
Gates Lumber Company, Wilmar, Ark.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, August 1, 1916 No. 15

Great Britain May Put a Duty on Wood Goods

One of the most important developments in connection with the public in Great Britain, as a direct result of the war, is the remarkable alteration that has taken place in connection with the attitude of the public upon tariff matters. We are accustomed to thinking of Great Britain entirely as a free trade country and to feel that the exponents of the tariff theory in regard to imports were of minor importance so far as results likely to be achieved were concerned. The war has entirely changed public opinion in Great Britain upon this all-important subject, and now practically everyone, including the old free trade party, is expressing opinions to the effect that after the war Great Britain will have to throw aside its free trade policy to a very great extent.

The effect that this is likely to have upon the lumber trade is of much importance, and from present indications it appears that the export trade in lumber and other wood goods from Canada to Great Britain is likely to be affected more definitely and advantageously than any other branch of the trade. We are impelled to express these views by an exceptionally interesting article that was published in the Timber Trades Journal, of London, England, on July 1st, and which, on account of its interest to the export trade in Canada, we reproduce herewith.

In the palmy days of party politics before the war shook up the nation and aroused us to a greater sense of national feeling, it was scarcely possible, this article says, to discuss freely and impartially any question of social or commercial reform. The party spirit had taken such a hold upon the nation that an idea or a reform adopted by one side was almost certain to incur the opposition of the other; and so it came to pass that matters, even of national moment, were considered less from the point of view of the nation's welfare than from that of party advantage. But the country is now assailed by a foe whose power was never realized, and all Englishmen have, to a great extent, forgotten the old quarrels, and are endeavoring to be ready after the war to make a start on an altogether different basis.

Probably no question aroused a more bitter feeling than that of Free Trade v. Tariff Reform. Learned professors and practical business men argued the matter for years, but so strong was the party feeling that, previous to the war, it was the rarest of occurrences to find any notable change of view from the one side to the other. Few, however, are now prepared to endorse their former views in their entirety; some of the leading free trade exponents have declared that the old conditions are no longer possible; and, on the other side, Mr. Austen Chamberlain, among others, has stated that he cannot ratify all he said on this question in past days. The recent Economic Conference at Paris shows also what a vast change has taken place. Great Britain was represented at this conference by leading lights in two formerly hostile camps, and yet unanimous recommendations were made, for the war has cut right across our old party lines, and an alteration in our fiscal policy is recognized everywhere as absolutely essential to our future peaceful development. And even those who still adhere to the belief that free trade is theoretically our best policy recognize that we have now allies to whom we are bound by the strong tie of a common enemy, that these allies have never held the views which have largely obtained in this country, and that it is therefore our duty to give way to the majority, and to render our assistance in the economic measures which it is thought will be necessary in the near future.

In war prepare for peace is becoming as great an article of faith in this country as its antithesis has been in Germany; and, as Mr. Hughes said in one of his speeches, it is necessary to act at once, or at any rate to have the ground thoroughly prepared for immediate action at any moment.

In the timber trade the question will arise whether any import duty is to be put upon wood, whether the raw material is to be taxed, or partly manufactured wood, or wholly manufactured wooden articles; and, further, whether a preference is to be given to our colonies and allies. The question opens up a very wide field of speculation, and we can only now glance briefly at some of the aspects of the subject on the broadest lines. We would not, in the first place, ask whether the timber trade, or any section of it, would be benefited by an import duty on wood manufactures (for the interests of a particular trade are not always identical with those of the nation), but whether such a change in our fiscal policy would be a national gain or loss. We quote again from Mr. Hughes, a statesman who has made a great study of these questions, and who has been specially honored by our Government:—

"Let me state what are the terms of the problems which will confront us after the war. First, there are the millions of soldiers who will return from the war and the millions of others engaged in making munitions; added to these are the men now employed who before the war could not find employment. Are you going to tell the men who fought and saved the Empire that there is no place for them, or, at any rate, no place worthy of them? Are you going to turn those adrift who are now carrying on the work of the country? And what are you going to do with the million of women workers who are now doing the work of men? Do you not see in your mind's eye the streets crowded with these millions of returned soldiers, munition workers, workers of all kinds, men and women, all suddenly confronted with the frightful consequences arising out of the dislocation of industry?"

One of the great problems after the war will undoubtedly be to find employment in this country, and we would put this aspect of the question before all others at the present time. If sawn wood is taxed, and the tax graduated and increased as the sawn wood approaches the stage of a completely manufactured article, the result, provided the duty is adequate, will be to keep out of the country the manufactured products and to increase the demand for English labor. This is, we think, the main argument which will apply in present circumstances. It would formerly have been objected that in this way we are not obtaining the goods so cheaply. Perhaps not, but cheapness in itself is no longer a fetish to be worshipped. Strength is required,

and "the real strength of a nation lies not in material wealth or amount of trade or extent of territory, but in the number and quality of its men and women."

As to details, a 10 per cent. ad valorem duty on floorings and mouldings would be more effective for revenue purposes than as a protective measure; probably 15 or 20 per cent. would be required, at any rate at first, but even this might not be sufficient to prevent the large importation of doors, frames, and other fully manufactured articles of wood. The details will require a good deal of thinking out, and as fiscal changes are imminent, timber merchants will do well to give their attention to the subject. Possibly some of our readers will favor us with their views. There will be vast readjustments after the war, and those matters which are not thrashed out beforehand will, when the necessity for prompt action arises, not receive the attention they deserve.

War's Effect upon European Timber

Aside altogether from the effect upon European markets of the demand for lumber and timber arising out of the war, it is important and interesting to note its effect upon the standing timber resources of those countries that are engaged in the struggle, and especially those that are located within the range of operations. Belgium, the major portion of which is in possession of the Germans, had some forested land which was, as it might well be termed, more of a scenic than a commercial nature. These forests have practically been destroyed. Much of the timber was used by the Germans for military purposes—in the construction of trenches, in road building, in the erection of shelters, barracks, etc.; considerable was used for firewood, and it has been stated, with what accuracy it is impossible to say, that timber not used in this way or needed in the military zone has been shipped to Germany for home consumption. Most probably this is so. As regards Belgium, it would not be at all surprising to learn, when the war is over, that there remains on Belgian soil no timber of commercial value; that her scenic forests have been wiped out, and that thousands of her roadside and street trees have been used for fuel and for other purposes by the Germans.

In Northern France, on both sides of the fighting front, great damage has been done the forests, not only by the tremendous bombardments which have marked the fighting there, and by the hail of bullets from small arms which have swept forested spaces, but by the trench builders, the road engineers, and others who needed timber for construction work. Thousands of new roads or passageways have been built for the rapid transportation of guns, munitions, supplies, and men, to thousands of points along both fronts. Many of the roads or passageways are of the type known as corduroy roads, the base being made of tree trunks, overlaid with branches, and these branches overlaid with earth. These roads alone necessitate the cutting of thousands upon thousands of trees. In the lining of trenches and the building of shelters there has been unceasing demand for more and more timber, and when it has been on hand in the shape of single trees, groups of trees, woodlands or forests it is fair to assume that it has been freely used.

In addition, the destruction by shot and shell has been tremendous. Trees that have not been blown down or cut through or shattered have been so badly damaged that they will die; others, pitted with bullet holes or wounded by other shot, are now open to disease or insect attack, while there are long stretches of forested lands where there has been no fighting not much is known, but the inference is that, owing to the unceasing military demands for timber, the annual cutting is very much greater than it was in times of peace, and this means, doubtless, that practically all timber that has matured has been cut and used, for France, like England, was in times of peace a large importer of timber.

There is no occasion for concern regarding Russian forests, for the losses due to warfare are infinitesimal when compared with her tremendous forest resources. Then, too, even in the forests where there has been severe fighting the damage done the trees is hardly worthy of note, because the forests are so dense and so extensive. Russia, with her wonderful forests, will have a great opportunity for an immense lumber business when the war is over, and if she can take advantage of it she will become the main source of timber supply for all the warring countries of Europe.

It is certain that Germany has done a great deal of cutting in captured enemy territory, chiefly in Poland and Western Russia, and that she has conserved her own forest resources in the thoroughly efficient and scientific manner in which she has for so long managed her forests, but news of what she has or has not done would doubtless be of some military value to her enemies, and so in America nothing of importance has been heard regarding her forests.

The effect of the war on the forests of the British Isles will likely be the extensive conversion of many of them into timber. The war has created imperative need of lumber, and at the same time interfered with England's main source of supply as well as made prices for what can be imported almost prohibitive. In time of peace England's timber imports were valued at about $215,000,000 a year, and this figure gives some idea of the amount she has needed since the war started.

Mill Type Construction Making Headway

The awakening of interest in mill construction which is taking place in Eastern Canada is due to a number of causes that have been working together to bring home to the public an appreciation of the exceptional value and service which they get from such construction. One of the chief factors in this connection is undoubtedly the effort that is being put forth by the British Columbia Government to interest consumers in the use of the splendid timbers produced in the Pacific Coast province mills. When the war is over and conditions again approach normal so far as the general industrial situation is concerned, we believe that the manufacturers of British Columbia timber will find a gratifying demand for their products for use in mill-constructed buildings. Our conviction on this point is based largely upon the fact that the public are already showing more than usual interest, and at the same time are being shown in a practical manner what they can do with British Columbia products.

In Canada we are following, to a great extent, the lead of our friends across the line, who have been compiling a great amount of statistical and scientific information about mill construction and have been placing it before the average reading public. An example of the practical information which is thus being made available is furnished by the extended inspection trip recently made by Mr. C. E. Paul, consulting engineer for the Trade Extension Department of the National Lumber Manufacturers' Association. The object of his trip was to investigate conditions relating to the general use of wood in construction in the New England States. He visited manufacturing plants of all kinds, from the oldest cotton mill to the modern buildings still under construction, including warehouses, freight shops, docks, bridges, etc., examining them in detail with a view to comparing methods of construction used by the architects of the East and those of the Middle West. Mr. Paul's views, as expressed in a recent interview, are interesting.

In New England, he says, is the home of the original heavy timber mill construction building, and the type as built there is entirely different from the mill construction buildings in the Middle West. This difference is not due to the fact that our Middle West buildings are of comparatively recent date, but comes from different commercial needs and from peculiar economic conditions which exist in a given type of manufacturing plant. Cotton mills and woolen

mills use machinery which can be arranged to advantage in long, narrow bays or floor panels without the posts becoming a hindrance. The floor loads in such buildings are not heavy, but stiffness and lack of vibration are sought. These conditions lead to the extensive use of the so-called "standard mill construction," with bays 8 feet to 10½ feet wide and 20 feet to 26 feet long, as recommended by the Associated Factory Mutual Fire Insurance Companies of New England. Heavy yellow pine or Douglas fir girders support a yellow pine or spruce floor 3 inches or more in thickness. This flooring is splined and laid with closed joints. A ⅞-in. wearing floor of maple or other hard wood is laid at right angles to the main flooring.

The practice of placing an intermediate layer of rough 1-in. hemlock flooring between the main floor and the surface layer is quite common in the best buildings, and provides a very stiff floor. The intermediate layer is laid diagonally on the main floor, and waterproof paper is placed between each layer.

A great many manufacturing plants and mills were visited, and but very little complaint was heard in regard to the lasting qualities of the timber used in these structures. In fact, the general expression was one of satisfaction. One cotton mill one hundred and six years old was claimed to be largely in its original condition and is in use daily. Another mill built in 1825 was supplied with girders spanning three bays without a break and all in perfect condition.

In some of the more modern mills the floors in rooms where a large amount of water is used are supported by timber girders, which are creosoted before placing, and the flooring laid with a ½-in. space between boards. No trouble was reported in the case of girders thus treated even after several years of service.

When heavy timber floors are used on steel beams supported by steel or iron columns, a 4-in. by 8-in. nailing strip is spiked or bolted to the top flange of the steel beam and the nails from the flooring are held by this strap. The steel post cap is seen but little, while the cast iron cap with cast pintle is used by nearly all designers.

One of the leading engineers made the remark that manufacturing processes were changing so rapidly and the item of space needed was of such importance that the heavy timber mill construction type of building was the logical solution of the problem when changes were likely to be necessary or additions to plant to be built.

Extremes Meeting in British Columbia

It is not on every occasion that lumbermen and foresters see eye to eye, especially in regard to a question of marketing forest products. Not very long ago lumbermen had an idea that foresters were men who wanted to preserve the forests, even at the cost of the lumbering industry and irrespective of most considerations of reasonable utilization. Foresters, to a similar extent, were unable to look upon the lumberman as a reasonable citizen, and thought of him as a despoiler of nature's timber resources. There has been a considerable coming together of these two extremes since the early days of forestry in this country, and of late years this approach towards a better understanding of one another has been comparatively rapid.

An indication of the strides that have been made in this direction is afforded by the course of events in British Columbia. It is only a very few years since one of Canada's most capable forestry graduates was placed in charge of the Forest Branch of the Department of Lands of British Columbia, yet to-day we find his department taking most enlightened steps in the direction of scientific marketing of timber resources of the province, with a view to creating a wider demand and assisting in securing better prices for the output as a whole. The forester, in fact, when put in touch with the practical requirements of the forest and with the lumbering problems of British Columbia has applied himself and the resources at his command to the question of enlarging the return from the forests so as to make the logging and lumbering industries more interesting financially to the men who put their money into them. The idea is not to promote indiscriminate conversion of timber resources, but, by making the operation more profitable and extending its market scope to enlist the co-operation of the industry. In short, the lumberman and the forester in British Columbia have come so close together in their sympathies that they are overlapping each other's fields of operation; the forester helping in the marketing of the product and the lumberman assisting the forester in establishing sound scientific and economic regulations for the conduct of the industry which will assist in the preservation of the forests.

This is a long stride in advance, and one which holds out much promise for the success of the administration of the forests in British Columbia. We only wish that we could say as much for the situation in all the other provinces of Canada. The lumbering industry and forest administration must go hand in hand, and in proportion to the extent of their co-operation must be the permanence and success of each. For a time we wondered whether the rest of the forestry fraternity would look upon this matter in the same light as the Forest Branch of British Columbia, and whether they would approve wholeheartedly of the course adopted; not that we had any doubt as to the wisdom of this course, but that we were not convinced that the forestry world itself was ready to lend its aid to an extensive plan for increasing output and widening markets. There was no reason why they should not see things in this light, but just as a simple matter of fact we wondered whether they had kept pace with the Forest Branch of British Columbia in its appreciation of the fact that unless the material taken from the forests is properly marketed the forester and the lumberman will alike suffer. Apparently the forestry profession is behind its representatives in British Columbia heart and soul, as is shown by a reference to this subject in the June number of the Forestry Quarterly.

Referring to the publicity work and other efforts of the Forest Branch of British Columbia, the Quarterly pays tribute to the efficiency of the work, and continues as follows:—

"To cap the cilmax of this remarkable activity of the Forest Branch in securing markets, the Chief Forester, Mr. H. R. MacMillan, who is responsible for developing this phase of the Forest Branch, was appointed Special Trade Commissioner of the Dominion Department of Trade and Commerce, and has been traveling for nearly a year to all parts of the world, with a view to establishing trade connection for British Columbia mill products and furnishing insight through personal knowledge into special requirements of markets.

"Of course, all this literature, which is distributed freely by the hundred thousands, is frankly propagandist and advertising matter, but, considering the source, must be truthful and authoritative, devoid of extravagant claims which a private concern might make.

"From the forester's point of view at first sight, this canvassing would appear out of his field, but as a matter of fact, application of forestry methods can only be afforded when the cost of the dead work —dead for the present—always involved in any forestry work—work for the future—is covered by the price obtainable for the present product. To find profitable markets and extension of use of minor materials particularly seems to us a most needful undertaking, especially in British Columbia, where for years the lumber industry has been suffering by its distance from markets.

"There is one result which will come to the Forest Branch from this well-directed propaganda which must not be underrated, namely, that it will ingratiate itself with the lumber industry and through that with the politicians, so that it will be possible more readily to inaugurate conservative processes of forestry practices. We congratulate Mr. MacMillan on his enterprise in going out beyond mere routine administrative work."

While the work that is being done by the British Columbia Forest Branch and its representatives in promoting the use of British Columbia timber and lumber is meeting with good results in many parts of Canada, it is only fitting to remark that probably the most successful results are those that are being obtained in Eastern Canada, under the direction of the Lumber Commissioner at Toronto, Mr. L. B. Beale. Mr. Beale has covered much of the territory in Eastern Canada already, and is receiving many enquiries and a goodly number of them are turning into orders. This applies to points throughout Ontario, Quebec, and the Maritime Provinces.

Shell Box Prices—Are They Adequate?

Lumbermen Finding the Trade Risky—Complain That Shell Box Makers Cannot Pay for Lumber and Make a Profit

Although we have heard a great deal of discussion recently in regard to the shell box business in Canada, bearing chiefly upon the prices at which contracts have been awarded by the Imperial Munitions Board, we have avoided discussing the subject to any extent, feeling that it was wise to wait until the situation had been developed more fully and the pros and cons of criticism that we have heard had been more definitely sifted out. We have heard so much criticism during the past few weeks, however, that it seems to us that the situation now calls for some publicity. Briefly, the main point of criticism that we have heard from many quarters is to the effect that contracts have been let at such low prices that there is no profit in them for the manufacturers. It may be thought by some that this is an indication of good business on the part of the Government, or rather on the part of the Imperial Munitions Board, but when the matter is analyzed it is not difficult to see that by following out such a course the Munitions Board is really cutting off its nose to spite its face.

We cannot put this matter any more clearly or forcibly than in the words of a manufacturer and wholesaler who discussed the matter with us recently. This man, representing one of the most important Canadian firms, finds that in selling material to the box manufacturers he is up against a very different proposition to any that he has had to face in the past. In spite of the fact that he is dealing with firms that are handling very large orders for the production of shell boxes, he has to be on the watch every minute of the day in connection with the credit end of the business. He is gradually eilminating many of the customers whom he took on at first, finding that it is not safe to give them credit, and that without credit they cannot handle the business.

"In the first place," this lumberman says, in speaking of the Bethlehem box, "there is the question of cost for the production of shell boxes. The cost of labor, the cost of bands, steel, etc., are all very much higher than they were for the old boxes, and the price of lumber should be higher, but we cannot get it. The man who makes a contract for the box, in the first place, cannot cut down his labor cost, and there is a close enough combination among the steel producers to prevent him from cutting down the cost of steel. The only way in which he can keep down the cost is by traffiicking around with his order for lumber until he can get it at the lowest possible price. Naturally, the first result of this is a tendency on the part of the firm from whom he buys the lumber to furnish him with an inferior article. The lumberman has to do this in order to get his cost out of the order at all. It costs just as much more proportionately to produce lumber to-day as it does to produce steel.

"Then there is another feature of the situation that is of great importance. A large portion of the orders given out for shell boxes during the past two months have gone to concerns that are being run by a liquidator, or to concerns whose credit ratings are such that they are not entitled to the regular lumber terms of credit. The consequence is that if you want to sell material to them you either have to stand out for a straight cash discount before you unload the stock or take your chance of ever getting your money for your goods. Labor has no such a thing as a credit term. It must be paid for each week. Steel concerns will not give credit. As a consequence, the box manufacturers pay for their labor and pay the steel man, while the lumber manufacturer and dealer either holds his lumber or takes a considerable risk. If the box manufacturer can make good and work out a profit—which is questioned by most of the authorities upon the subject—then the lumberman will be paid; but if the box manufacturer falls down, as it is predicted that many of them will, the lumber dealer and the manufacturer of lumber are stung.

"The question, then, arises as to what protection the lumberman can get under these circumstances. Will the Government permit him to attach moneys due, or will they throw out an application for attachment, the same as they do when you try to attach the wages of a Government employee; or, provided they permit you to attach these moneys, will they then cancel the manufacturers' contracts for boxes? In the face of the great quantity of orders that have been placed for these boxes and of the fact that so many of the manufacturers are now falling down on their deliveries and dropping out on their contracts, would it not be possible for the Imperial Munitions Board to do something in the way of assisting those who are supplying these materials, so that they may be secure as to their money? The supplies of material are just as necessary to the quick and efficient delivery of munitions and boxes as the work that has to be done in their production, and are just as worthy of consideration from the Munitions Board.

"There is another feature in connection with the production of the Bethlehem box that calls for some criticism. In the production of these boxes it is stipulated that the diaphragms are to be produced from one quarter and five sixteenth inches veneer. This material costs about three times what it would have cost to produce the diaphragms in solid wood, and it is very questionable whether they are any better in veneer. The only material effect that the use of veneers for this work has had, so far as we can see is that practically all of this material, instead of coming from Canadian manufacturers who are paying taxes and bearing the brunt of our financial troubles, is coming from veneer manufacturers in Wisconsin, who, of course, are paying a duty to our Government when the stuff is imported, but are having 99 per cent. of the duty refunded as soon as the boxes are shipped out of Canada. On the whole, is there anything fair or equitable in the manner in which the Imperial Munitions Board are treating the lumbermen of Canada in this shell box situation?"

While we have heard numerous criticisms based pretty generally upon the above points, we have not so far invited our readers to discuss the matter. We believe that it would be well now to give the subject a good deal of publicity, and we hope that a number of our readers will let us hear from them, giving us their views, whether they happen to agree with those which are expressed above or not. If the price at which shell boxes are now being ordered by the Munitions Board is not sufficient to permit of the manufacturers doing their business on a sound and moderately profitable basis, the sooner the fact is properly appreciated by the Board the better it will be for all concerned. Our definite conviction is that the Board should make a detailed study of the cost of production of its shell boxes and make sure that orders given out are upon a price base that will not increase the financial difficulties of manufacturers in Canada to-day.

From the Canada Lumberman of Thirty-five Years Ago

Quebec's Great Crown Land Sale.

Quebec, 25th October, 1880.—The most important event in the timber trade since the date of my last letter is undoubtedly the recent sale of timber limits by the Crown Lands of the Local Government. It is an encouraging sign to those engaged in lumber that the prices obtained were much higher than have been paid for many years past. Nor can these prices be attributed, in my estimation, to any sudden excitement in the minds of buyers from the competition of the auction, or even from extravagant and speculative anticipations of further improvement in trade. The attendance of the sale included all of the best-known lumbermen from the districts of the Ottawa, Three Rivers, Quebec, and St. John, N.B. The purchasers were principally found to be of the most cautious, conservative, and experienced operators of the country. Most of them had either personally investigated the limits upon which they bid or possessed confidential information from explorers employed by them. Close observers at the sale noticed that some of the lots sold were knocked down to parties who were undoubtedly buying for leading capitalists sitting near them. Several of such were present, well-known business men, who, though not actually engaged in lumbering operations themselves, have been in the habit of advancing large amounts to those actually engaged in the trade. Larger prices than would have been otherwise realized were doubtless in some degree obtained by the prevalence of the impression that the pine limits offered at this auction were amongst the last really first-class wooded lands remaining in the hands of the Government of Quebec. Three hundred and forty-five dollars a mile is undoubtedly a big price, but there are in the trade very few who would care to insinuate that the money paid for the lands in block "A" of the Upper Ottawa Agency is too high. If the reports of the railway surveying party which explored this portion of the forest some ten yetrs ago are to be credited, most of the purchasers of these lots will realize fortunes out of them. For some few years to come they can, of course. look for no return, their lumber being, in the main, quite inaccessible. The Federal Government will have to be looked to for improvements in the streams, but as the pine becomes more scarce these improvements will have to be made as a matter of course. It is, too, by no means improbable that some of these lands will be partially opened up by the contemplated extensions of the various lines of railways in the district of Ottawa.

Lumbermen's Sons Serving the Empire

W. J. MacBeth, Toronto

The accompanying portraits are of Mr. W. J. MacBeth, Toronto, a well-known lumberman, and his two sons, who are serving the Empire in connection with the war. The portrait on the left of the double picture is of Second Lieut. R. E. MacBeth, and that on the right is of Capt. W. L. C. MacBeth, M.B., M.O., for the 4th Brigade, Canadian Field Artillery.

Capt. W. L. C. MacBeth, the elder of the two, is now located with his brigade in Flanders. He went across with the first contingent, and has been in France and Flanders since September 17, 1914. He received his commission before leaving Canada. Capt. MacBeth has been located at different times in the hospitals at Boulogne, Wimereaux, and Le Traport. From the latter place he was moved to Flanders. Before taking his course in medicine Capt. MacBeth had considerable experience of the lumber business at sawmills at Bracebridge and elsewhere.

Second Lieut. R. E. MacBeth is in the Royal Flying Corps. He left Toronto on January 1, 1916, having taken a portion of his course at the Curtis Flying School at Toronto Island and completing it at Catterick Bridge, Yorkshire, England. He "got his wings" about the first of June, and was sent to Montrose, Scotland, as an instructor. While engaged in this work he met with an accident on June 16, the engine of his machine going dead while he was flying with a

Second Lieut. R. E. MacBeth, Royal Flying Corps — Capt. W. L. C. Macbeth, M.O., 4th Brigade, C.F.A.

student over the North Sea. The machine and its occupants fell into the sea. The student's leg was broken and Lieut. C. E. MacBeth was severely injured in the head. In the fall of the machine their life-belts were punctured, but Lieut. MacBeth, in spite of his injuries, managed to remove an inflated wheel from the machine and put it upon the student, to act as a life-belt. He then managed to discard his uniform and to swim almost to shore, taking the student with him. Then he found that he was so exhausted that he could not negotiate the backwash, or undertow, and it was probable that both of them would have lost their lives if assistance had not come to them from the shore. A man on shore who witnessed the accident was able to swim out and bring both safely to land.

Lieut. R. E. MacBeth was severely cut about the head, receiving a gash from the left eye to the back of the head. He remained in the hospital for a month, and then secured three months' furlough in order to recuperate.

While his two sons have succeeded in giving their services to the country in connection with the war, Mr. J. W. MacBeth has not been so fortunate. He endeavored to secure a commission in two of the forestry battalions, but although physically he is a younger man than many who have been accepted, he has not been able to secure an appointment.

Why are we not organized for War?

A Northern Ontario manufacturer, writing to the Canada Lumberman, says:

"As the season advances the difficulty of securing sufficient labor to do the work is becoming greater, and the hardwood manufacturer suffers more than those cutting pine and other soft woods. The result will be that better prices must be obtained for stocks since the cost of producing them has increased so much.

"It is almost impossible to think that the Government are interested in the business of the lumberman and other manufacturers when they take no steps to organize the country industrially, and that is what must be done if we are to keep the industries of Canada working.

"It is well known that there are many thousands of eligible men who are not enlisted, and are not working at the real work of to-day, viz., producing raw material and turning it into marketable products.

"In these trying times, when the Empire is in the crucible, we can do with half the ministers, half the lawyers, half the insurance men, and altogether without the idle, purposeless men who are not bending their backs and working their bodies to the limit to help keep up our end.

"Conscription is a hateful word to the free man, but unless something of that nature is put in force it is hard to estimate the loss of life and property Canada will suffer. The means are ready. The Government can any day order every man to present himself for examination and enlistment, and if not fit to stand against the enemy on the battlefield, he can be used to supply the place of those who are gone and those who are fit and willing to go, but will not do so, and throw away the work of a lifetime.

"Take the sporting games and their supporters. How can men take part in such play when the gallant lads, who have given their all, are dying by thousands that the land they love may continue to float the flag of freedom? It is not fair, and it is not right.

"Prospects for a reasonable cut of logs for the coming season are poor, and if the Government does not take hold of the work at once it will be too late to save the day."

The Lumber Dealer and the Substitute

A subscriber of the Canada Lumberman, after reading an article which we recently published, dealing with the question of substitutes for lumber, reports to us that there is much truth in the points made in this article. "We are so built upon our past," he says, "that we sit quiet and let the substitute fellow have his own way. Pushing the goods is what does it. Why a man will neglect our goods, which have been giving him good satisfaction, and use substitutes is hard to say, but nowadays the barn is covered entirely with steel or with stove pipe, and with coal tar and rags for roofing, instead of the wooden shingle that has given splendid satisfaction. Lately I have been asking myself why the farmers are not building now, when material is at a reasonable price, and I have been told that the answer is that they are panicky on account of the war. But they are not panicky when it comes to a question of buying automobiles. Farmers in motor cars are coming into town by the score; and, while a new barn or fence or other improvement would look in place, they are not attending to them. It seems to me that the lumberman will simply have to act as the allies have until lately—that is to say, "hang on and hope for better things."

Prairie Crop Prospects Encouraging

Mr. Geo. J. Bury, first vice-president of the C. P. R., in a recent interview, said:—"I have been putting together reports from our officials, our numerous agents, and several hundred farmer correspondents; I have talked with farmers, business men, and others throughout the West, and I can come to only one conclusion; the crop prospects at the present time are of the best. It is too early for a prediction as to the expected yield. One thing, however, I will say, comparing last year with this year, the crop prospects are better than at this time last year. True, there is not so much acreage sown to wheat, and it is almost impossible to get the acreage accurately, the estimates of decrease varying from six per cent. to twenty per cent. But even with a decrease of an average between six per cent. and twenty per cent., conditions generally are more healthy in the West than they were one year ago. Apparently more land is being broken and summer fallowed. Couple with that the same old optimistic spirit that made the West what it is, and one finds a combination that is quickly dissolving the depression that existed. The only thing we need now, is more people on the land, and I predict with a good crop this year, we will see a great influx of farmers from the south. After the war, the eyes of the people of the countries now torn by conflict will turn toward this country, and we will then see immigrants coming in great numbers."

John Hendry Passes Away

Mr. John Hendry, one of the best known lumbermen in British Columbia, died at his home at Vancouver on July 17th. The late Mr. Hendry had been failing in health for some time and his death was not unexpected. He had been living in British Columbia for 44 years and had large interests in timber and mining in many parts of the province. He was one of the outstanding members of the industry and one of the active forces in bringing about the great advances that the industry has made of late years. Mr. Hendry was a director of the Canadian Lumbermen's Association.

The late Mr. Hendry was a man of large interests in timber and mining throughout British Columbia. He was born in New Brunswick, in the district of Belle Dune, County Gloucester, on January 20, 1843, his father having come from Ayrshire, Scotland, in 1840, and established large flour and lumber mills at Belle Dune. In the summer of 1872 John Hendry went to British Columbia, but subsequently settled in Washington Territory, where he remained until 1873. In the latter year he returned to British Columbia and entered the employ of the Puget Sound sawmill. About 1875 he went to the Red River country, but only remained a short time. Returning subsequently to British Columbia, he gradually increased his business interests until, at the time of his death, or previously, he occupied the following positions: President of the British Columbia Mills Timber and Trading Company, president of the Vancouver, Westminster and Yukon Railway Company, president Nicola Valley Coal and Coke Company, president British Columbia Lumber and Shingle Manufacturers, Limited, director Western Canada Power Company, chairman Burrard, Westminster and Boundary Railway and Navigation Company, vice-president Canadian Lumbermen's Association, Canadian Forestry Association, Commissioner of Conservation of Canada, and president of the Canadian Manufacturers' Association.

Sudden Death of R. M. Bertram

Robert M. Bertram, 134 Spadina Road, Toronto, died suddenly of heart failure at Collins Inlet on July 17th. Mr. Bertram was well known among the lumber trade of Ontario, having been vice-president of the Collins Inlet Lumber Company, of Collins Inlet, Ont., with head office at Toronto. The late Mr. Bertram was apparently in good health and had gone north for a summer holiday. He is survived by his wife and three small children.

Newfounndland's Timber Resources

Sir Daniel Morris, in an address before the Royal Society of Art at London, England, recently spoke at considerable length of the timbered areas of Newfoundland. These were generally found, he said, in the valleys of the larger rivers and on the banks of the lakes and ponds. In many cases they were confined to strips from one to two miles wide. There were about six and a half million acres of wooded lands in the colony. All the known timbered areas in Newfoundland, except those lying within the three-mile limit of the shore reserved by the Government, were held under license by private parties or by companies. The conditions under which these licenses were issued gave the holder the right to cut timber for a term of ninety-nine years on payment of an annual rental of two dollars per square mile. In addition there was a royalty of fifty cents per M feet B.B., payable on all timber cut on the area, except such as was manufactured into pulp or paper. In the production of sawn or manufactured lumber there were a dozen large mills in Newfoundland, and ten times as many small ones, producing cooperage stock, barrels, shingles, and laths. In 1906-7 the value of the exports of sawn lumber reached a total of £65,000; but this had since fallen off, due, it was thought, to increasing local requirements. Water power was abundant, and leases were granted by government for terms of years of the right to use the waters of any river for driving machinery, on payment of a rent and subject to a fine of £100 for each offence of introducing sawdust or other injurious matter into the water.

The spruce lumber was of exceptional quality. It was used locally for general building purposes and for ship and boat building, and in the case of the smaller logs it provided a very superior material for manufacture into paper pulp. A very small proportion of the birch timber was utilized, the principal uses being the construction of the under-water parts of the hulls of cruisers and for wharf piles, as the wood was found to last better than most others under such conditions. It was used for various other purposes, among others that of the manufacture of furniture.

The smaller timber of Newfoundland was chiefly used for the manufacture of paper pulp, but since the outbreak of the war there had been a considerable export of pitprops to Great Britain. An enquiry had been made by experts into the cost of supplying pitprops to this market, and one of these experts had expressed the opinion that the cost need not exceed that of pitprops from the Baltic.

Sir Daniel gave a long list of the forest trees which grew in Newfoundland. Besides the black spruce and the birch already spoken of, he mentioned among others white pine, balsam fir, tamarac, sugar maple, black ash, and American elm. Several of these produced valuable woods, useful for a variety of purposes. Forest fires were the cause of a loss to the colony estimated at from £1,000,000 to £2,000,000 annually; they were very largely due to sparks from railway engines. Once an area was cleared, reafforestration took from thirty to fifty years.

Western Trade Improving

Reports received from British Columbia and prairie province points indicate that the lumber trade is showing encouraging improvement. This is to a considerable extent the result of the prosperity of the prairie province farmers. On account of the large crops harvested last year the farmers are today enjoying good credit with the banks, and are commencing to spend money to a considerable extent upon buildings of various kinds. The good crops that are now practically assured for the present year are adding their influence to this improvement. The effect upon the lumber situation is outlined in an interview recently given by Mr. Alexander Wood, manager of the Rat Portage Lumber Company. "All the mills which are at present operating," he says, "are getting as much business as they can handle. The outlook is excellent. Information we are receiving from the prairies is everywhere encouraging. Crop prospects are of the best. Lumber stocks are very low and there seems to be no question that the demand for B. C. lumber from the prairies will be well maintained. Eastern Canada is also taking a lot of lumber, and a number of the mills in Vancouver are going after trade in the United States, and have already secured good business. Our own concern has shipped a considerable quantity to American points and believe that a lucrative trade could be developed there."

Referring to the demand for B. C. timber and lumber for war purposes, Mr. Wood said that a large quantity of material was being cut in Vancouver for Old Country buyers. There was a specially strong demand for spruce for aeroplane construction. His own company had already handled a large quantity of this material, which was cut into heavy stuff and realized a good price. There was some difficulty, however, in securing a large enough quantity of the absolutely clear stock required for this purpose. "It is a mistaken notion," Mr. Wood said, "that there are unlimited quantities of spruce on the coast. The fact of the matter is that the quantity of spruce on the coast which is really suitable for high class lumber is small. The trouble with spruce is that it is a knotty timber, and you go into a spruce forest and you will find that the limbs on nearly all the trees come down close to the ground and in most cases it is not possible to get more than one good clear log out of a tree. All the orders we are receiving for spruce for aeroplane construction now specify that the boards must average from twenty to twenty-four feet in length and be perfectly clear, and anyone who knows anything about spruce knows that it is hard to get that kind of stuff out of a spruce log. The percentage of good clear lumber that a sawmill could take out of the average spruce log is very small and the balance of the material is all the more difficult to dispose of."

Discussing a large order for spruce on which the British Government recently asked for tenders, Mr. Wood said that, so far as he could learn, the order would be a very difficult one to handle, because of the scarcity of logs and the fact that the material had to be cut on the quarter, and was for delivery in the Old Country, making the shippers responsible for the freight.

Booth Papermakers Get Wage Increase

J. R. Booth has granted a 6 per cent. increase in the wages of all the papermakers employed in the mills, in compliance with a request from a committee of the papermakers' union. The wage schedule at the plant, which was formerly not at the same level as has been reached in other parts of Canada, is, as a result, as high as at practically any other plant. Owing to the number of enlistments for the war there is a scarcity of skilled papermakers all over the country, and higher wages are being demanded. Besides the wage increase there will be no Sunday work, as formerly. The Lord's Day Alliance has been insisting on the observance of Sunday at the various lumber and paper plants at the Chaudiere Falls, and has threatened to take action if the Booth plant should attempt to run its paper mills Sunday morning. As a consequence, the firm decided that it would be better to stop work at midnight on Saturday till midnight Sunday.

The directors of the Riordan Pulp and Paper Company have declared a dividend of one per cent. for the quarter ending July 31, making 2½ per cent. for the first seven months of the company's fiscal year.

The prohibition of the import of birch planks from Canada into Great Britain has been modified to some extent, and at present licenses are being granted for the importation of a limited quantity of these goods.

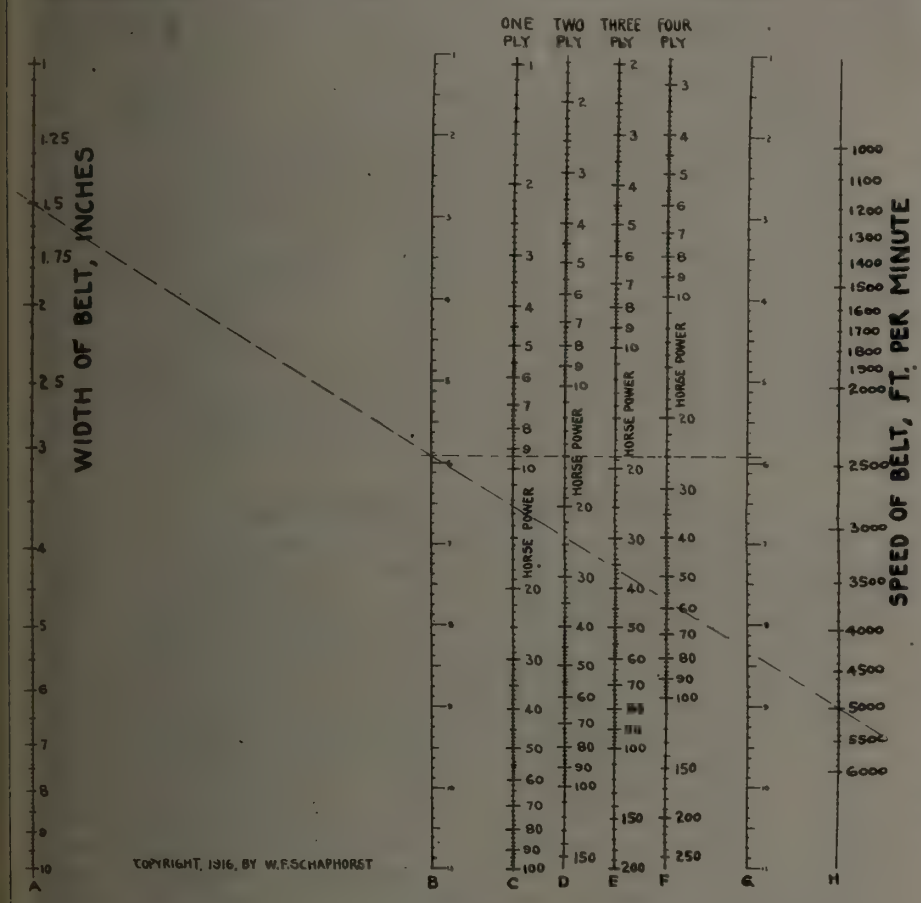
A Practical Belt Chart

This chart will be found handy for solving belt problems for nearly every ordinary condition. You can work it out by just laying a straightedge across from point to point, and the job is done.

For example: What horsepower will a 1.5-inch belt pull when running at 5,000 feet per minute? Find 1.5 in column A. Find 5,000 in column H. Connect the two with a straight line. This straight line cuts column B between 5 and 6. Find the corresponding point in column G (i.e., between 5 and 6). Lay the straight edge across as indicated by the dotted line. The points of intersection with columns C, D, E, and F give the horsepower that one, two, three, and four-ply belts will transmit.

A 1-ply belt would, therefore, transmit a little over 9 horsepower.
A 2-ply belt would transmit 15 horsepower.
A 3-ply belt would transmit about 19 horsepower.
A 4-ply belt would transmit 25 horsepower.

Of course, the chart can be used "backwards" just as easily. If it is desired to transmit 100 horsepower, for instance, with a 3-ply belt, the reader will easily discover how the process is reversed. Let us



assume that the belt is to run 4,500 feet per minute. The answer is: A 9-inch belt will be required. Try it and see if you get the correct result yourself. The final point falls between the 8 and 9-inch points, but so much closer to the 9 that the 9 should be chosen.—W. F. Schaphorst.

Securing Maximum Service from Sanding Machinery

By A. T. Deinzer

Sanding is one of the things that ordinarily cannot receive too much attention. In most factories a very high finish is demanded. As the quality of the finish depends on the way the wood is cleaned up, the necessity for good sanding is at once apparent. The manufacturer whose sander work is not giving full satisfaction will do well to visit woodworking plants in his vicinity or to correspond or talk with manufacturers of sanding machines, for I am certain he will gain information that will help him out considerably and prove profitable in every way. One hears operators say, "We have the same make of machine as Jones and Co. They are having no trouble sanding stock perfectly but we have no end of trouble with this machine. The manufacturer certainly unloaded a lemon on the old man when he ordered and paid for that piece of junk." My argument in a case of that kind is, if your machine is of the same make and style as that used by Jones and Co., it ought to do the work as perfectly as does the machine your friends are using. There is no doubt that you are handling your machine entirely different than they and as a consequence your results are also different.

Too little attention is given the feeding mechanism of many sanders. It is not uncommon to see sanders feeding the stock to the second roll and there become stuck. The operator will push on the feed end, do more or less cussing and blame the boss for buying such a "d——— machine."

The feeding mechanism must be in perfect adjustment if it is expected that the stock will travel through the machine. The operator should see that his drums are not too high nor his idle rolls too low. Indeed, neglect to take this precaution has often resulted in a ruined drum covering, in addition to spoiled paper. It is by far the safest plan to raise the drums to the desired cut and lower the idle rolls to the desired pressure while the first piece is passing through the machine. Pressure rolls that are down too heavily will cause hollow places.

One of the most common causes of scratchy stock is that of not having the front drum low enough, so that it cuts too heavily, while the back drum is not raised enough. However, all the drums may be too low and the pressure rolls too heavy, so that as stock slides along over the bars, grains of sand get in between stock and bars and cause scratches.

If waves appear, look to lost motion in the oscillators for the trouble. Vibration while oscillators are in the centre of their stroke, causes a slight depression, which disappears at the end of every stroke, resulting in close-set, regular waves. When stock or paper is burned and the feed is jerky, the rolls may be too high or the drums too low, so that the pressure soon wears out the paper and burns the stock. The same thing happens when rolls are slipping because of oil having been spattered over them, as a result of oiling up while in motion.

An irregular line left standing above the stock is usually the result of a defect or depression in the sandpaper, which is not cutting at that point. The oscillating motion of the drum causes the line to "snake" lengthwise over the stock. A nail or foreign substance in the wood will cause the same mark, by tearing out a streak of grit in the paper. The only way to correct this is to re-cover the drum.

If drums are run too slowly, sandpaper will wear more quickly and will not cut as fast and smooth as when running at their proper speed. Here is where the manufacturer of sandpaper frequently comes in for unjust criticism of his brand of paper, whereas, if the truth were known the fault would often be found in the slow speed of the machine. Remember this: To perform its work most satisfactorily the mechanism of the sander must be driven at a specific rate of speed, We already explained what will happen if driven too slow. If, on the other hand, the machine is driven too fast, the paper will glaze over and burn the stock.

Another thing worthy of some consideration is the proper care of sandpaper before being used. It is all too common in many plants to see rolls of sandpaper hung in some damp corner of the shop until used. We know, or should know, what dampness will do to sandpaper. The paper must be thoroughly dry so that the sand will not come loose from the warmth and strain of service. One will find some who will favor putting paper into a hot box before using. An objection to this is that the paper will become too dry if left in the hot box for an unreasonable length of time. Sandpaper too dry will cause trouble for the reason that it has a tendency to break and fly, for the sand will not hold as well as it would if there were enough moisture to relieve it of its harsh dryness.

The care of felt is something that receives too little attention, for proper attention will give surprisingly large returns, not alone in the saving of garnet paper, but in the quality of finish turned out. The felt should be brushed with a good quality bristle brush each time the papers are changed.

In sanding birch, oak, elm or any other hardwood with a drum sander, much depends upon the condition of the lumber as it comes to the machine. If the lumber is thoroughly dried and smoothly and evenly planed so that it does not require much stock to be removed in the polishing of the same on the sander, a much finer grade of paper can be used throughout the machine and a better finish obtained.

Most manufacturers test glues, varnishes, oils, coal, etc., when purchasing these for their plants. Why not test the sandpaper? Indeed this is possible. Experiments will not only show wearing quality, but one can determine what paper will be the cheapest to use, i.e., quality and price considered. Records should be kept of these tests, and I am certain the little time required will be well paid for both in saving of money and improved quality of the work.

The sander needs a certain amount of lubrication. So much can be said about proper lubrication that we have neither the time nor the space to properly deal with the subject in this article. Graphite and graphite greases are excellent lubricants. In fact any lubricant that has body and can be spread out comparatively thin will do the trick. Be careful when oiling the sander not to smear up a lot of stock, possibly on trucks near the machine about to be, or already sanded.

Last, but by no means least, inspect the sander frequently and see that it is leveled up properly and see that it is firmly anchored to the floor. We know only too well that vibration is the natural enemy of all machinery, especially machinery possessing fast revolving parts. So do not place the machine on a shaky floor. If it is absolutely necessary to do this then at least support the floor with timbers directly beneath, which may help some.—Yates Quality.

Pacific Coast Structural Timbers

Their Strength and Suitability for Mill Construction Described in Detail in Hand Book by O. P. M Goss

The West Coast Lumbermen's Association, 1016 White Building, Seattle, Wash., have published an excellent "Structural Timber Hand Book on Pacific Coast Woods," written and compiled by O. P. M. Goss, Assoc. M. Am. Soc. C. E., Consulting Engineer for the Association. The purpose of the book, which is carried out in a most commendable manner, is to present information relative to structural timber which will be useful to engineers, architects, and contractors. Particular attention has been given to Pacific Coast species. In addition to a large amount of valuable, descriptive and explanatory matter, the book contains all available and practical statistical information regarding the strengths and other important characteristics of Pacific Coast woods. It will be of value to all who are interested in the matters with which it deals.

While it will be impossible to give anything in the way of a summary or even a description of the book, which is a very detailed compilation of facts and figures, we are glad to have an opportunity of reproducing part of what it has to say in regard to the construction of mill buildings. "In recent years," the hand book says, "improvements have been made, in the construction of mill buildings. These improvements have been of such a nature as to reduce maintenance cost, fire risk, and insurance rates, and to insure a longer life for the structure. This discussion will be confined largely to that type of building known as the timber-brick mill building.

"There are a number of significant details which should be considered in the design of every modern mill building. The addition of these details is inexpensive, and the accruing benefits far outweigh the added cost. Some of the most significant features which should receive consideration in the design of the highest class of mill building, are as follows:—

1. All exterior windows should be fitted with wired glass in metal frames;
2. As many subdivisions in the building as are practicable should be provided, both horizontally and vertically;
3. Protect timber details where necessary with a brush application of coal-tar creosote, or other suitable preservative;
4. Install an automatic sprinkler system as a fire protection;
5. Use only large timber joists, girders and posts.
6. Use wide spacing of joists, and thick tongued and grooved or laminated floors;
7. Laminated floor timbers should be thoroughly kiln dried before being placed in the building, to prevent dry rot;
8. Provide stairway and elevator enclosures.

"The cost, durability, and insurance rates on a building and contents are factors which concern the builder who must finance the building. He will naturally endeavor to get a building low in first cost, and also low in insurance and maintenance cost. In other words, he will or should strive to get the greatest possible returns for each dollar spent. The following discussion bears on the above factors, and presents information which is of vital interest to the builder.

Durability

"The durability of a mill building may be greatly increased by a few simple operations. The decay of wood, which is hastened by the presence of damp air and poor ventilation, starts most readily on the end grain of timbers such as girders and columns. This fact should be recognized and methods of construction so modified as to prevent conditions favorable to decay. Dry lumber should be used wherever possible and in the construction of laminated floors all lumber should be thoroughly kiln dried before being placed in the structure.

"Girders or joists which rest in masonry walls should not be sealed in. An air space of at least two inches should be provided all around the end to allow proper ventilation. Two brush applications of hot coal-tar, creosote or other suitable preservative will assist materially in preventing decay. Ends of girders or joists should rest on cast iron plates or joist hangers, and the bearing surface should be protected by a piece of creosote-saturated felt or asbestos.

"Columns, when resting on concrete or brick piers, should have ends thoroughly painted with two coats of hot coal-tar creosote, and a piece of thin creosote-saturated board should be placed between column and pier. A metal plate between the pier and column end is also desirable. Creosote applied to the ends of columns between floors will also assist in preventing dry rot.

"The above details are particularly necessary in buildings which are unheated, and are desirable in all buildings. The ends of large girders and joists should never be encased in such a way as to prevent seasoning through the end surface. Seasoning takes place more rapidly through the end grain than from any other surface, and seasoned timber is safe from dry rot just as long as it is kept dry.

"The limited use of coal-tar creosote as above described should not increase fire hazard. There are, of course, other preservatives such as zinc chloride and corrosive sublimate which could not possibly increase fire dangers. These preservatives are likely to be less effective, however, than coal-tar creosote, and corrosive sublimate is a deadly poison.

Cost

"The cost of mill buildings has been well established, and diagrams included in the hand book enable one to estimate quickly the costs on varying sizes and heights of timber—brick mill buildings with floor loads up to 75 lbs. per square foot. The diagrams are based on the following unit values given by Chas. T. Main, M. Am. Soc. M. E., in the Engineering News of January 27, 1910, for the various materials used:—

"The cost of brick walls is based on 22 bricks per cubic foot, costing $18 per thousand, laid. Openings are estimated at 40 cents per sq. ft., including windows, doors and sills.

"Ordinary mill floors, including timbers, planking and top floor with Southern pine timber at $40 per M. ft. B. M., and spruce planking at $30 per M., costs about 32 cents per square foot, which has been used as a unit price. Ordinary mill roofs covered with tar and gravel, with lumber at the above prices, cost about 25 cents per square foot, and this has been used in the estimates. Add for stairways, elevator wells, plumbing, partitions and special work.

"Other detailed and very complete information is given regarding special conditions which will result in variations in the cost.

"In conclusion, the section of the hand book dealing with this subject says:—"The modern timber-brick mill building is approximately 25 per cent. lower in first cost than a fire-resisting building, and is given almost the same advantage in insurance rates. Throughout the Pacific Coast territory where timber is inexpensive, and plentiful, the difference in cost between these types of buildings will probably average above 25 per cent.

"Wood construction is safe when the proper design has been used. Its low first cost and maintenance, and its low insurance rates are strong arguments in its favor which should be carefully weighed by architects and engineers when contemplating the design of new buildings."

Commercial Uses of White Pine

The uses of white pine are so diversified that several pages could be filled with the mere enumeration of them. In the day of wooden ships white pine was highly important for masts, spars, figureheads, and decking. Boats and canoes were frequently fashioned from white pine logs. Floating docks made of white pine logs or timbers serve their purpose perfectly, decades after other kinds of wood have become waterlogged. Bridges, aqueducts, and structures of a like nature were formerly built entirely of white pine timbers, where they were not required to bear excessive strains. Many of the old covered bridges of Pennsylvania and West Virginia were built of white pine timbers, enclosed with white pine siding and covered with white pine shingles. So durable have these bridges been that it was said of some of them that "no man had lived long enough to both witness their building and their failure through decay."

White pine has always been the wood of universal excellence for constructing houses, barns, sheds, and other buildings. Early in 1880 Michaux estimated that, aside from other cities, there were half a million houses in the United States that were built of white pine wood. New York and New England States abound with splendid examples of beautiful colonial houses constructed of white pine, that have stood for more than a century, or even more than two centuries, testimonials to the wisdom of the early builders in selecting white pine in preference to the other materials equally available. Not long ago ten white pine beams were removed from a building in New York City, after doing service for fifty years. These beams were 18 inches thick, 2 feet wide, and 50 feet long, free from knots or defects, and perfectly sound, after a period equal to an ordinary lifetime. Some of the beams are now being used as temporary supports in the New York subway excavations, in a position where their light weight, strength, and length give them superiority over metal or other kinds of wood.

White pine is unequalled as wood for lath, siding, light dimension, sash, doors, blinds, planing mill products and general mill work. White pine shingles are of high order of merit. Where it is not subject to heavy wear, white pine makes a serviceable flooring. Porch columns, pumps, patterns, picture frames and penholders are all made of white pine, because the wood is less affected by moisture than other woods, neither shrinks, checks, nor warps, holds plain and gilt finish well, and its soft, even grain makes it an easy wood to work with any kind of tools.

Moulding, ceiling, panels, shelves, caskets, baskets, woodenware, refrigerators, toys, trunks, tubs, shade rollers, and skewers are a few of the common uses of white pine. On the farm and in the home, the shop and the factory, this wood has uses galore. Fences, wagon beds, parts of vehicles and machines, wheelbarrows, windmills, handles, beehives, chests, and shelves are a few of these.

For a period of 200 years large quantities of white pine were used

for such articles of furniture as bookcases, cupboards, counter tops and tables, desks, benches, stools, and chairs. While not well adapted to all of these uses, it served its purpose, and for drawing-tables and drawing boards it has no equal. It is also one of the best woods for all kinds of boxes and crates, except for the heaviest shipping, because it combines fair strength with light weight, and its light, even color and the smooth surface of the planed wood makes printing show to advantage. Much white pine is manufactured into fish and lard buckets, pails, washtubs, churns, ice cream freezers, spice containers, etc.; it is also a high-class wood for tanks and silos and barrel headings. Logs of white pine were formerly used for wooden water pipes, for which they served better than most woods. Excelsior and match sticks are two other commodities in which white pine is preferred above other woods.—American Forestry.

Stirring Up Trade When It Is Slow

The harvest time in the small grain raising sections of the country is always a period of dullness and intermittent trade for the country lumber dealers, as it is for practically every merchant in the town. What farmers' trade there is comes mostly in the evenings and Saturdays. When there is little building or repairs going on in the town a lumber yard is a dull place to be in as far as business is concerned. The promise of future business, however, is bringing in new stock to be taken care of, and the yard man doesn't think it dull for him, but the man who runs the yard considers it dull in the absence of trade to send it out again, and when he gets his clerical work done in the office he has little to do unless he goes out into the alley and helps to make the piles grow.

I don't think, though, that the yard bosses do as much of that kind of work as they used to. There are comparatively few yards to-day but that employ one or more men to do the heavy manual labor of the yard. Older dealers can remember the time when unloading and piling was a part of our regular work as managers, and even the unloading of coal as well. Many have run the yard as I did, single-handed, and done all the work. There were few dull days for us then in the matter of work, even in harvest time.

In the times of drought, however, there was little doing of anything, and the monotony of those days was worse than the hardest work. Out in the new towns, where there were no trees, the lumber yard shed gave the most shade of any place in the town, and idle business men would gather there on a hot day and pitch horseshoes or sit on the end of a shed pile and whittle; many a game of horseshoes has been played and cans of beer "rushed" on a hot afternoon in the shade of a lumber shed. A business man in those days only dreamed of taking a vacation. He never considered the question of taking it then, for he generally was too poor to afford it, and when he was busy he couldn't get away. But no matter whether there is much trade or not there is no less of service the lumberman can render to the busy farming community.

After a dull day the impulse is stronger than usual to close up the yard at six o'clock and go home. But during harvest time someone should be at the yard until dark and longer if necessary, because farmers work late in the grain field, and if they have an urgency case needing some lumber for repairs they generally use the late hours of the evening to drive into town to get them. And when they arrive at the yard and find it closed they feel an annoying disappointment that is liable to affect their future relations with that yard. I know this seems unreasonable, but it is a fact nevertheless that farmers have got an idea that business men should keep their places open at all hours to accommodate them, and it is difficult to educate them to think differently, because the exigencies of a farmer's business are such that he is compelled at times to utilize every hour of the twenty-four that is possible.

Long Hours Are Necessary.

Long hours on a farm as are necessary in harvest time mean long hours for some of the town business men if they would give him the service when he needs it the most, and so from now on through harvest and threshing time the yard should be kept open, for there is no knowing when someone will drive in, after the usual quitting time, for a few pieces of lumber or a load of coal for the steam thresher. It is not so much for the profit on what is sold in such cases as it is the value that such service will be to the yard later on when trade becomes normal again. I have gotten out of bed late at night at the call of a farmer who wanted a piece of hardwood to repair his harvester so he would lose no time in starting up the next morning. He appreciated it, and that fall I sold him a nice barn bill without any competitive figuring.

A general reputation for accommodations of this nature is one of the best assets a dealer can have in a country town. The friendship of farmers for a business man is largely based on an accommodating spirit of this kind, and is one of the best antidotes against the influence of a close figuring competitor. If a man has a strong preference for trading with you it's on account of the good treatment and service you give him. This sort of thing soon becomes known in a country community, and therefore it has a commercial value. We often wonder how it is that a Jew merchant goes ahead of the average Gentile in business. There are several reasons that are not necessary to mention, but one reason is that he is always at his place of business early and late to sell service and gather in the shekels that other merchants miss through being too independent. Indeed, his willingness to do this causes adverse criticism of him by his fellow-business men. I have never known a retail lumberman who was a Jew. There is something about the business that don't seem to suit them. It's well, perhaps, for the comfort of our present retailers that they don't' like it, for if they sat in the game lumber yards would be open seven days in the week and no limit to working hours week days.

Now, understand, I am not in favor of stretching the day's work any more than is necessary, but it is not good policy for country dealers to be too particular about closing time at certain times of the year or at any other time when service can be given by keeping open, otherwise than on Sunday, of course. I have even sold coal on a Sunday in cases where it was absolutely needed, and didn't think, either, that I was cracking the Mosaic commandment against Sunday work.

Should Keep an Assortment.

The use of wood is so universal for our requirements; there are so many things it is used for other than in building, and the lumber yard in a country town is practically the only place where it is sold. Therefore, a recognition of this should be had by the lumberman in keeping an assortment of such stock as will meet the needs of all kinds of repairs for things made of wood. It is a standing advertisement—and a good one—to have it generally known that you can get anything you want at a certain yard. In the later years of my experience in a country town I tried to do this, and I thought a good deal of knowing that it was said: "If you can't find it anywhere else go to 'Kit's' yard and he'll fix you out." There were times when I had in stock more or less of about every commercial wood that was then in use. I won't say there was much profit in it, but I am so constituted that I hate like the dickens to have anyone come to the yard for something and not find it. So I studied the kinds of implements the farmers were using, the sizes of the pieces in their construction, and I kept these sizes, as well as I could, in ash, oak, and hickory, together with inch and half-inch poplar. At one place where I was I carried a full assortment of wagon, buggy, and implement stock. This was bought in quantities direct from the manufacturers, so that I could sell the local wagon maker cheaper than he could get it from the jobber and pay local freight besides.

Oftentimes it happens that a machine breaks down when a farmer is cutting his grain or threshing, and if there is not the right kind of wood at the lumber yard to repair it some time is lost before it can be gotten. Many a time I have supplied just such a need that otherwise they would have had to wait for till it was obtained from a jobbing centre. Aside from such cases as these, implements and machinery on the farm are continually breaking or getting out of repair, and there is a corresponding need for the suitable materials. And where a farmer knows he can go to the lumber yard and get what he wants of it he is pleased, too, that he doesn't have to run around hunting for it. And if he is not a regular customer, the chances are he will continue to trade there. Some dealers don't like the carrying of this class of stock because customers demand that it be cut off at a length to suit them which is likely to leave a short end that nobody else will want. There was a time when I objected to this, too. But, before a great while, I found that I could comply with such requests and still not lose anything by it. I sold it by the lineal foot at a price that would cover the waste of a foot or two off the end of a piece. I adopted this method of selling all my hardwood excepting common plank for bridge purposes. It's mostly a matter of making up your mind to get in this class of stock for cutting up purposes. If you quote the price per lineal foot to a customer he may ask how much you will take for the whole piece. In that case a discount will likely influence him to take it without cutting. This is the way I sold all cut-off stuff of any kind of lumber. Sometimes it stretches the good nature of a dealer to be asked to cut off a piece from an extra wide select, but by charging enough for it there will be no loss in the long run. Of course, if you have any clear plank over twenty inches wide, the scarcity of such widths in white pine makes them more valuable for counter tops or sign boards. I usually laid such pieces away out of sight. In other woods, however, you can get all such wide widths you want and have some for cutting to suit the customer.

Must Accommodate the People.

The main thing of all this is the idea of accommodating people with what they want and have it generally understood that it may be obtained at your yard, and that you are competent and willing to help them select what is best for their purpose. A lot of boys used to come to my yard here for pieces to make stilts with, and for many other things boys think they can make. While it was considerable bother sometimes to get at what they wanted and wait on them, still it was a satisfaction to have the children come to me for such assistance. The manual training class of a nearby school used to come and ask me all sorts of questions about lumber and of the different kinds of wood. Sometimes the teacher would send a note by one of the

pupils asking for information not in the text-books. I know, of course, that manual training is not common in the country town schools, but the lumber dealer can, if he will, do something to develop the building instinct and mechanical faculties of the boys of his locality. Boys like to make something, to tinker round and fix things. Some develop this tendency at an earlier age than others. Some time ago I visited the manual training department of one of our schools and I was astonished to see the things made by boys whose ages ranged from ten to fourteen years. It was fine, too, to see the zeal and enthusiasm they put into their work. I thought at the time what an opportunity a country town lumber dealer had to educate the boys in his town to use lumber and teach them the many interesting things about the different woods in his yard. It would be a good idea for him every now and then to give an informal talk to the students of the high school class. Not only the boys, but the girls, too, would be greatly interested in an informing talk of this kind. Get the boys to making bird houses, sleds, little wagons, doll houses for their sisters, little things useful for their mothers, and any other little things that suit their fancy.

But, of course, the larger number of country town boys have no money to spend to buy lumber, and many parents cannot afford to get it for them; therefore, you may think of this idea as being impractical. Now, if you are a believer in advertising and practice what you believe in this regard, would it not be well to divert from the sum you set for this expense an amount representing the cost of, say, a thousand feet of common boards to give away to the boys for this purpose, letting them have it, of course, under such restrictions as you deem wise, such as requiring them to show what they have made with it. This lumber you furnish need not be of the regular lengths. You can obtain a lot of "shorts" from the mill that will answer the purpose and do as well as longer stuff and at less cost. If you give the boys the material there is no question but that the parents will furnish them with the tools to work it and other furnishings needed also. I would also include the country small boy as well in the proposition. A few small prizes offered, too, would stimulate and help keep up the interest. Then, again, on this line you could set a day for having the boys bring in what they had made, have a public display of the assembled exhibits in some vacant storeroom in town and invite the public to come and inspect what the little folks had made of their own designing and handicraft. If you advertise this public display in the local paper, and have it some Saturday, I"ll warrant you will be astonished at the large number of people who will come to view it. It will beat any movie show in town that day, for no matter how crude the design and workmanship of any of the little articles shown they will touch the feeling and elicit the interest of every father and mother who comes to see it. At the close of school here last month the rooms of the manual training department were crowded all day with the parents of these pupils and others of the community interested in school work.

It may seem a whole lot of bother for a business man to undertake just to minister to the pleasure of a lot of other people's children, and on the face of it no possible financial returns for the outlay. "What's the good of it all to me?" is the natural question I know that will be asked by those who are content to keep along in the rut of the usual and ordinary. I"ll tell you the reason why I have thought this plan out and given it here as I have.

One of the problems of the retail lumbermen to-day is advertising, and the appreciation of the need for it is spreading among the country dealers. But the great drawback to their doing it is they don't know how to do it in a way that will bring the returns they expect from their efforts. They are conscious that they don't know how to write ads for themselves, and this acts as a deterrent against their trying it; therefore, they muddle along and get business in the usual way they were brought up to do. Now, I believe the scheme I have suggested is one that any dealer of ordinary intelligence and gumption can carry out and make a success of. There is no possible question about its attracting attention and arousing the interest of the community, for it is one of the fundamental facts of the social fabric that the main interests of people are wrapped up in their children, and whatever attracts the children is sure to interest their parents, especially if it is something that will give the children pleasurable occupation and benefit.

It is self-evident, also, that the friendship of every man, woman, and child in the community is something to be greatly desired, and when secured by the lumber dealer or any business man is a valuable asset and assistance in the growth of his business. The more you can get people to talk about you in a friendly and praising way the greater the attraction your yard will have for them when they want to buy anything you've got to sell. Business secured in this way is of the most enduring kind because it is actuated by the personal goodwill of the buyer. When you do an act that is a social benefit you advertise yourself, and when people think of building materials they think of you. So, then, if you can't write advertisements for the paper do something that arouses the interest of the children and you will attract the attention of the parents.—C. H. Ketridge, in the Mississippi Valley Lumberman.

The Danger Spots in Connection With Sales and Deliveries —How They Can Be Avoided

By M. L. Wuescher

A claim, in its final analysis, is the result of a mistake or misunderstanding. To treat this subject intelligently it is necessary first to determine definitely at what points claims develop, and their causes.

A careful study of the matter brings forth the fact that usually the causes of all claims develop at three given points:—

First—In taking the order from the customer by the salesman.

Second—Execution of the order by the mill.

Third—Inspection and tallying of stock on receipt of car by the customer.

In order to treat this broad subject in a logical manner, let us first consider the causes of claims, originating at the time the salesman solicits and accepts the order from the customer.

Experience teaches us that the usual causes of claims at the first point, or at the time of taking the order by the salesman, can be classified as follows:—

Making errors in the description or in the price of lumber in transmitting the order to the mill, and by not having all data pertaining to the order written into the order rather than in an accompanying letter.

Inserting wrong routing or incorrect rates in the order transmitted to the mill.

Making special agreements with the customer regarding stock and not sending sufficient information to the mill covering the transaction.

Not advising the mill on orders for special stock for what purpose it is to be used, if possible to ascertain this information, and in the case of orders for special worked stock not accompanying same with blue print, whenever possible.

Selling lumber on comparison.

Salesmen not being entirely familiar with conditions at the mill and its operation.

Liability of misunderstanding between customer and salesman, in the description of lumber or prices, in soliciting and accepting orders over the telephone.

How They Could Be Minimized or Eliminated.

Claims from the above causes could be minimized or practically eliminated if the salesman would pay close attention to the following:

All salesmen should have a standard and uniform method for writing up the order. This order should include all instructions, special routings, correct rate, and any other information, rather than to put same in an accompanying letter.

Salesmen should also be familiar with the routings and rates applying to their territory. In case the customer desires special routing the salesman should be very careful to see that the routing specified will not increase the rate to the point of destination.

Make no special agreements with customers as to the class of stock to be furnished, unless you advise the mill wherever it is possible, the use for which the material is intended. If the stock is worked special, accompany the order whenever possible with a blue print showing the correct working.

Lumber should not be sold on comparison with stock manufactured by other mills, for, in the event of a claim, there is no mutual ground for settlement, or an arbitrator on whom you can call.

All salesmen should be familiar with the conditions at the sawmill.

When an order is accepted over telephone be sure a confirmation is immediately sent you, and compare same with the order sent the mill.

Execution of the Order by the Mill.

Experience also teaches us that claims usually develop during the execution of an order at the mill from the following causes:

Errors in grade.

Errors in tallying.

Shortages.

Mis-manufacture of lumber.

Poor planing-mill work.

Errors in invoices and price.

Difference of understanding between the sales office and the shipping department.

Shipping lumber during unfavorable weather conditions.

Shipping green lumber.

Putting wrong routings in bills of lading.

Mill being forced to use equipment not adapted to order, especially during car shortages.

Not shipping proportion of the correct lengths.

Inspection of Stock on Receipt.

The customer and his assistants who receive the stock are only human; therefore, are liable to mistakes. The principal causes of claims and disputes originating with the customers may properly be classified under the following heads:

The human element, or the natural difference of opinion between

the employes of the customer and the employes of the mill, particularly in rallying and grading, for grading is not an exact science, and a reasonable variation of opinion between the inspectors should be recognized.

Rough handling and breakage of lumber when unloading same from the car.

Natural disposition of purchaser to compare the lumber of one manufacture with the lumber of another.

Actual mistakes in tallying and checking the lumber.

Extremely technical inspection by the buyer of lumber on a declining market.

Delay of shipment of the car beyond the time promised by the mill.

The settlement of disputes or claims must necessarily be done on an impartial and equitable basis, and should on their conclusion be satisfactory to both the customer and the mill. However, salesmen settling claims with customers should continuously bear in mind that they are in the employ of the manufacturer, and should guard his interest very carefully.

When a claim is filed by a customer, full and complete information should be submitted to the mill immediately, not simply advice that the car has been refused or that a claim has been made on part of the shipment.

Information for an Adjustment.

In order to handle the adjustment in a most efficient and most business-like manner, the following information should be furnished the mills:

Car and order number.

Condition of delivering equipment, with seal numbers, if any.

General condition of the load.

Full and complete report as maintained by the customer.

Full report of stock in accordance with your best judgment, including grade marks.

If stock has been unloaded, whether or not any of it has been sold or re-manufactured and the manner in which it is being taken care of, whether stacked in the open or under cover.

Best adjustment that is acceptable to the customer, with recommendations as to whether or not it should be accepted by the mill, and, if not, what other disposition you can make of the lumber.

All of this can be incorporated in one letter, so that definite, prompt, and final action can be taken by the mill without endless correspondence.

In conclusion, all salesmen should remember that claims mean monetary loss to the mill, and if by following some of the foregoing suggestions claims can be avoided, it will be much easier for salesmen and beneficial to the mill, to assist in forestalling disputes rather than to effect their settlement.

Sales of Lumber to South America

A report describing the markets for lumber in Chile, Peru, Ecuador, Colombia, Venezuela, Trinidad, and Curacao has been issued by the Bureau of Foreign and Domestic Commerce of the United States. It is entitled "Lumber Markets of the West and North Coasts of South America," Special Agents Series, No. 117.

Chile and Peru are the two big markets, although the lumber imported by those two countries is almost exclusively Douglas fir. Ecuador is unique in using practically no imported lumber, but would be a promising field if the tariff were low enough to permit American lumber to enter at a lower price. Practically all the lumber imported by Colombia and Venezuela comes from the United States, but the amounts are small—2,000,000 board feet annually for Colombia and 3,500,000 feet for Venezuela. The limited use of wood in both countries (total consumption only 13,000,000 feet in Colombia and 8,000,000 feet in Venezuela), in comparison with cement and other materials, points to the need of a lumber-advertising campaign, through which these markets might be greatly extended, says the report.

Among the topics treated in the report under the various countries are the domestic resources and industry, the lumber imports and their distribution, the species, dimensions, costs, prices, uses, etc., of imported lumber, business conditions, and suggestions for expanding American trade. Supplementary data are given concerning special wood products—furniture, matches, cars and ships, ties, poles, boxes and shooks, wood pulp, barrels, flooring and ceiling, and sash, doors, and blinds. There are also lists of lumber importers and dealers, lumber yards, deposits, mills, wood-pulp consumers, principal mining industries, nitrate, oficinas, and railroads of Chile, and sawmills importers, and dealers of Peru, Ecuador, Colombia, Venezuela, and Trinidad. This report completes the record of the investigations conducted by the bureau into the lumber trade of South America, a similar report for Argentina, Uruguay, and Brazil having been published some months ago.—U. S. Commerce Reports.

Though the Canadian National Exhibition only dates back to 1879, the first Exhibition, from which the C. N. E. grew, was established in Toronto in 1846.

Miscellaneous Items of Interest to Lumbermen

Mr. Henning Helin, technical manager of the Wayagamack Pulp & Paper Company, has been elected a director of the company.

Canada's exports of forest products during the twelve months ending April for the past four years were valued as follows:—1916, $51,629,899; 1915, $42,705,384; 1914, $42,797,161; 1913, $43,646,733.

Readers may be surprised to learn that there are manufacturers still using flint and who do not seem to want to consider garnet. Agreed that flint is sharper at first, but is it not a fact that being less hard it soon wears dull?

An interesting order of which were were advised recently while calling upon a Toronto wholesale firm is one they received for red pine deals for India. The stock was 4-inch, 3-inch, and 2-inch, unsorted, and amounted to 100,000 feet.

The timber returns for the month of May, issued by the B. C. Minister of Lands, show that the total scale of sawlogs for the province amounted to 94,771,871 ft. b.m., in addition to 335,573 lin. feet of piles and poles, and 20,388 cords of ties, shingle bolts, etc.

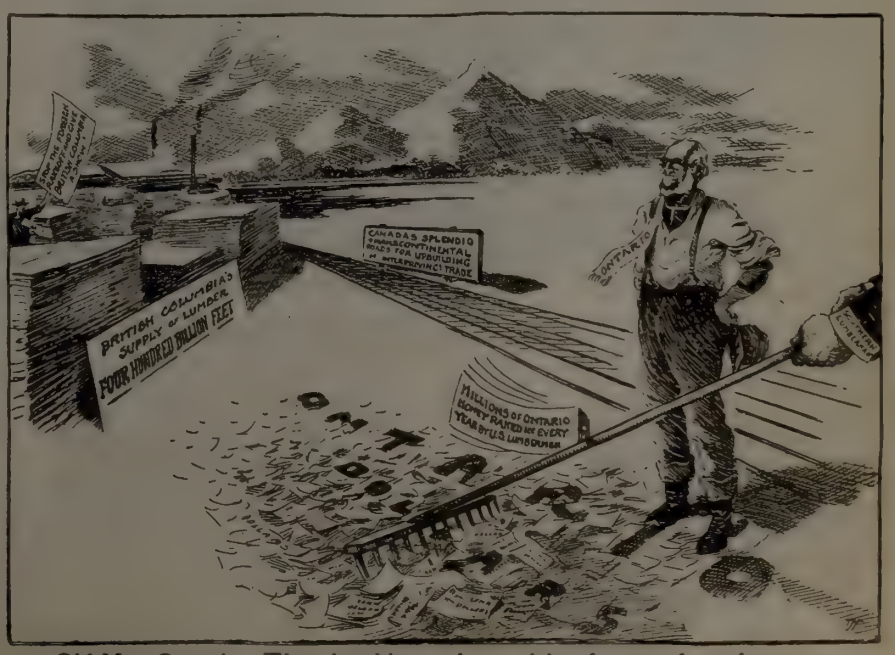
A New York cable report states that the International Paper Company has plans made for a 200 ton newspaper mill to be erected in Canada. It is officially stated that this mill will produce newsprint, round wood pulp and a surplus production of sulphite pulp.

Reports received by Inspector Geo. D. McKay, state that a number of the larger B. C. Coast logging operators are closing down their operations for about four weeks during the last two weeks of July and the first two weeks in August, in order to prevent a glut of logs.

In a letter received recently from A. I. Beaton, Lieut.-Colonel, Assistant Engineer-in-Chief of the South African Railways, he says:—"We are going to experiment with some of your timber for sleepers—"Douglas fir. If they prove satisfactory there should be a great market here for them."

A report received at Ottawa from Trade Commissioner Sontum, of Christiania, Norway, says that the export of woodpulp by Sweden to Great Britain may again be allowed. While Norwegian prices for bleached sulphite for export are $186.67; easy bleach, $160 to $173.33; strong, $146.67 to $160, and kraft soda, $133.33 per long ton, net cash to makers, f.o.b. Norwegian ports, in Sweden prices keep about $66.67 lower.

Crown Timber Agent E. W. Beckett reports from New Westminster that the small mills in the Fraser Valley are exceptionally active this season and that the lumber business is showing greater signs of prosperity than at any time during the past three years. Many shingle mills also are springing up at points where merchantable cedar is available in Canada, and are buying stocks extensively from farmers.



BRITISH COLUMBIA'S SUPPLY OF LUMBER

"There's One Best Way"

There's one best way to buy and sell special lots of lumber, second-hand machinery, timber lands, etc., and that is by inserting a small advertisement in this department.

Every mail brings word of big results from these small ads. Last week a large lumber firm sold their entire 1916 cut, several million feet, through an advertisement on this page

What Have You to Advertise?

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Wanted—Quotations on 1¼ in. and 1½ in. Hard Maple lumber. J. H. Connor & Son, Limited, Ottawa, Ont. 15-16-17-18

Wanted—1-in. Dry Beech. Must be plump in thickness, sufficient to dress to 7/8 and 1/16. Please quote prices. State quality and what year cut, at once. Shurly-Dietrich Co., Ltd., Galt, Ont. 15-15

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Birch Wanted

WANTED—10 Cars 2½ in. No. 1 Common and Better Birch for Fall delivery. Buffalo Hardwood Lumber Company, Buffalo, N.Y. 14-17

Wanted—Lath

Please quote us your best cash price on the following, either delivered Cleveland, Ohio, or F.O.B. Mill, giving rate to Cleveland:

⅜ x 1½ — 4 ft. No. 3 White Pine Lath.
Same—Red Pine.
Same—Spruce.
⅜ x 1½ — 4 ft. No. 2 White Pine Lath.
Same—Mill Run White Pine Lath.
Same—Spruce.

THE AMERICAN LUMBER CO.,
1502 New England Building,
12-15 Cleveland, Ohio.

For Sale–Lumber

For Sale

2 000 Cedar Poles 25 to 45 ft. long; 4,000 Cedar Fence Posts 4 in. and up, 8 ft. long; 2,000 No. 2 Cedar Ties, 3 in. face and up. Lynch & Ryan Lumber Co., Marmora, Ont. 12-15

For Sale

One car 3-in. Practically Clear White Oak, all 12 ft.

Two cars 1½, 2, 2½, and 3 in. No. 1 Common and Better Dry Red and White Oak, all Ohio stock.

The Probst Lumber Company,
15-18 Cincinnati, Ohio.

For Sale

3 cars 1 in. Cull Black Ash.
3 cars 1 in. Cull Spruce Boards.
8 cars 2 in. Maple, No. 2 and 3 Common, about 20 per cent. No. 2. All old dry stock.
3 cars 7/8 log run Elm, sawn round edge.

A. H. CUMMINGS & SON,
15-15 Coaticook, Que.

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
875 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale–Machinery

Saw Mill Machinery For Sale

Two (2) New Waterous Band Mills.
Two (2) 2½ A. Log Carriages.
Two (2) Gun Shot Steam Feeds.
One (1) Dittbener Band Re-saw.
One (1) New Champion Edger No. 405.
One (1) Standard Two-saw Trimmer.
One (1) Overhead Slat Slasher.
Lath Mill Machinery.
Rolls and Drives.
Transfers.
One Refuse Hog.
Sorting Table.
Filing Room Machinery.
Live Rolls, Boxes, Shafting and Driving Chain.

All of the above is new and was never used

For particulars write to Bayl ss Pulp & Paper Company, Binghampton, N. Y., U.S.A.

Machinery can be seen at any time at Beaupre, P. Q. 14-15-16-17

Saw Mill Machinery

Complete equipment for 40,000 capacity mill, including belts, conveyors, etc., with or without boilers and engines. For sale cheap to quick buyer.

St. Maurice Lumber Company,
15-15 Gaspe Harbor, P.Q.

Machinery For Sale

A small "Ad" under this heading, telling of what machinery you have for sale, will immediately put you in touch with buyers. Send us a list of machinery items and we will quote you on a small "Ad." Send the list now, before you forget about it. 1-t.f.

FOR SALE

Woodworking Machinery

1 Woods No. 32 Matcher; 1 Goldie 10-in. Moulder; 1 Goldie 24-in. Matcher; 1 Cowan 42-in. Sander; 1 Jackson Cochrane 36-in. Sander; 1 Egan 36-in. Single Surfacer; 1 McGregor-Gourlay 2-drum 30-in. Boss Sander; 1 Egan 30-in. 2-drum Sander; 1 CMC 8-in. 4-side Sticker; 1 McGregor No. 212 30-in. Double Surfacer; 1 No. 180 Berlin 30-in. Double Surfacer; 1 American No. 26 Hardwood Matcher, with boring attachment and end matcher; 1 Ballantyne 12-in. Sticker.

P. B. Yates Machine Company, Limited,
13-t.f. Hamilton, Ont.

Machinery For Sale

Woodworking Machinery for sale, consisting of Planers, Band Saws, Hardwood Flooring Machines, Mortisers, Buzz Planers, Shapers, Mitre and Tennoning Machines, etc., also Steam Boilers and 300 H.P. Steam Engine, Shafting, Pulleys, and large quantity of leather belting. Also a complete Sawmill outfit, a large stock of Rough and Dressed Lumber, Sashes, Doors, etc., manufactured and in process of manufacture. Reply to the Tobin Manufacturing Company in Liquidation, Bromptonville, P.Q. 12-15

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Young man, four years experience in sawmill office as stenographer and bookkeeper, desires change. Good references. Box 424, Canada Lumberman, Toronto, Ont. 14-16

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

A few good saw mill men wanted, good board and lodging, steady work until snow flies.

JOHN B. SMITH & SONS,
15-15 Callender, Ont.

RELIABLE EXPERIENCED MEN WANTED to scale, grade or tally pine lumber at saw mill, Midland, Ont. Only competent men considered. State full particulars.

Holt Timber Company, Ltd.,
15-15 Midland, Ont.

Business Chances

Timber Tract and Mill

Valuable Timber Tract, British Columbia; nearly 10,900 acres; 60,000,000 feet of timber; on railroad. Local market for mine props. First class mill, 30,000 feet daily capacity. Very attractive proposition. George W. Grant, P. O. 1676, Calgary, Alta. 13-16

Business Opportunity

Make your opportunity knock at the door of every Lumberman in Canada by placing a small "Ad" about it in this column. Our rate is $2.10 per inch per issue. Now is a time when monied men are seeking good bargains. What have you to offer? 1-t.f.

Business Opportunity

Wanted immediately a high-grade, experienced man to take charge of all or part of a pine logging and manufacturing operation of good size in Ontario. A fine place for the right man. State full particulars needed for arriving at judgment in first letter. Please do not apply unless you can make good. Box 426, Canada Lumberman, Toronto, Ont. 15-16

Timber Limit For Sale

Thirty-six square mile limit, North Shore, License allows cutting all kinds of timber. Contains Hemlock, Birch, Spruce, Pine, Cedar Ties and Poles, Pulpwood and Hardwood. Railroad runs through part of berth. Cheap operation. Splendid opportunity for small mill. Apply Box 423, Canada Lumberman, Toronto, Ont. 13-t.f.

Saw Mill

For sale on Muskoka Lakes, saw mill complete; daily capacity 20,000 feet. Good trade connection; plenty of timber available. Rare opportunity. Must be sold. Owner deceased. Terms reasonable. Box 418, Canada Lumberman, Toronto, Ont. 12-15

For sale or to rent—The long-established business of The Amherstburg Planing Mills & Lumber Yards. Buildings are fully equipped and contain 15,000 feet of floor space and dry kiln. Splendid prospects. Apply to

The J. R. Park Estate,
15-16 Amherstburg, Ont.

For Sale—Modern Saw Mill

and 300 Million feet of standing timber in British Columbia, most advantageously located on beautiful lake and main line of Transcontinental Railroad having advantage of $3 per thousand feet in freight rates to best markets on the Continent. Logging and manufacturing conditions ideal and very economical. A fortune for the right parties. Will sell on easy terms and may accept other desirable property in part payment. Principals only.

A. C. FROST COMPANY,
Corn Exchange Building,
14-17 Chicago, Illinois.

Miscellaneous

Several carloads of sawdust.

GEORGE A. OLDREIVE,
15-15 St. Thomas, Ont.

For Sale—Well equipped small seagoing tug, name "Shirley." Marine boiler, condenser, steam anchor winch, etc., 55 ft. x 15 ft. beam. Draft 7 ft. Can be seen at Quebec, care of J. L. Lachance Limited. 15-16

Complete Logging Outfit

En bloc or in part, for sale, consisting of sleighs, chains, snow plow, cookery outfit, saws, axes, blacksmith's outfit, etc. Located in Northern Ontario. For particulars apply Box 100, Canada Lumberman, 119 Board of Trade, Montreal. 15

Market for Building Timber in Netherlands

At a meeting in Amsterdam of an association of employers and workmen in the building industry, gloomy reports were made regarding the supply of timber for building purposes. Holland has more woodlands than most foreigners suppose, but they are far from sufficient to supply the needs of the country for building timber, and without imports from other countries few houses could be built in the Netherlands.

In the opinion of the association of builders the situation is serious. Timber is now imported from Germany, Sweden, and Norway. The quantity obtainable is small, and most of it is of inferior quality. Continued supplies from Germany can not be relied upon, the association believes, as the German Government has need of the surplus timber and will pay a higher price than this country has paid.

The building association gives warning that unless relief measures are taken the supply of wood most needed for construction work will be exhausted within a few months and great stagnation and unemployment in the building trades may be expected. Already several woodworking factories have ceased operations.

This situation suggests that American manufacturers and exporters of building materials might profitably give renewed and special attention to the Dutch market, with a view to both the present and the future.—U. S. Commerce Reports.

Cost of Waste Disposal

A great deal has been said concerning the quantity of wood wasted in milling operations, in the form of sawdust, edgings, blocks, and scraps of various kinds, and the public is fairly familiar with this subject; but investigations have now been made which claim to show what it costs to dispose of this waste. It is asserted that every thousand feet of lumber sawed in the United States is called upon to pay from eleven to twenty-two cents to meet the cost of getting rid of waste material. The average figures show a cost of seventeen cents per thousand feet, but in some mills it runs as high as twenty-two cents and in others as low as eleven. The yearly total is about $6,000,000 for the whole United States.

These figures are furnished by the Forest Products Laboratory at Madison, Wis., and it appears that this investigation was the first ever conducted in a thorough manner to determine what it costs to burn the refuse matter at sawmills.

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

Review of Current Trade Conditions

Ontario.

Probably the most important feature in connection with the lumber trade of Ontario at present is the fact that the manufacturers in the northern sections of the province are up against the wall in regard to the labor problem. From all parts of the province the same story comes, namely, that the manufacturers cannot find a sufficient number of men to enable them to load their cars, and at the same time keep their mills running. Each day that passes the situation is becoming more critical, and it has already resulted in a considerable reduction in output. Unless some relief, which at present cannot be figured upon, is experienced an extensive curtailment is probable. The effect of this upon the retail trade is rather difficult to anticipate. Everything naturally depends upon the demand experienced by the retailer. Even with a moderate amount of trade, however, it seems to-day that the reasonable course for the retailer to pursue is to anticipate the requirements of his trade and place orders in advance, as a scarcity of stocks at mill points and a scarcity of labor for loading cars will make it unusually difficult to get stocks in the fall if there is an improvement in trade, or even if trade goes along on a quiet basis.

So far as the actual volume of trade is concerned to-day, most of it is concerned with the shell box business. The demand for white pine continues strong. Red pine production this year is likely to show a decline of quite 30 per cent., as compared with last year. The trade in spruce is fair, and the price advances which took place early in the spring are steadily maintained.

The demand for British Columbia shingles is active, and prices continue firm at $2.40 for XX, $3.35 for XXX, and $3.70 for XXXXX. The demand for XXXXX is improving gradually, the trade having taken kindly to the decision of the manufacturers not to make any more XXXX.

The large war orders that were given out recently for shell boxes have resulted in a good demand for the lower ends of hardwoods. It looks as though stocks of low ends will be practically off the market before long. The consumption has already almost wiped out dry stocks, and will soon be right on top of the new cut in the lower grades. In the upper ends there is the usual midsummer lull. Outside of the shell box business the trade is quiet, with the exception of basswood, stocks of which are scarce. The moulding trade is using up large quantities of basswood. Those who have been enquiring into the available stock of basswood report that a shortage already exists. The major portion of the trade are only now waking up to this fact.

Eastern Canada

Advices from St. John, N. B., state that the export trade to Great Britain has practically come to a standstill for the time being, as English buyers have stopped making purchases of deals for future delivery. No prices seem to interest them at present and they are apparently waiting until the freight situation clears up. It is reported that stocks of deals in Great Britain are heavy and that the demand is light. At St. John, the stocks of deals are fairly extensive and are increasing, as a result of the lack of forward business. The local trade is also very quiet, building operations being almost nil. Prices for low grade stocks are easier and stocks of refuse are extensive at all north shore points. Laths continue unsteady and shingles show no change. The American market is also unsteady, but is expected to improve as a result of the passing of the Mexican war cloud.

The hardwood market at Boston continues steady. The demand for eastern spruce has improved a little during the past fortnight and quotations are stiffer, but there has not yet been any actual advance in the base quotation on frames. Retailers apparently have come to the conclusion that they need not look for any further decline and are placing orders. An advance in spruce quotations to $26 is expected in some quarters. Curtailment of production has been successful in assisting the market. There is an improved call for random and the tendency is upward; the range is as follows: 2 x 3 inches, $20.50 to $21; 2 x 4 inches, $21 to $21.50; 2 x 5 and 2 x 6 inches, $20.50 to $21; 2 x 8 inches, $23.50 to $24; 2 x 10 inches, $25.50 to $26.50; 2 x 12 inches, $26.50 to $27.50.

The hemlock market at Boston is not as firm as it was a month ago, having been adversely affected by the weakening of the southern yellow pine and North Carolina pine markets. The full range of quotations on eastern hemlock boards, stock lengths of 10, 12, 14 and 16 ft. clipped, is still $21 to $22. There is a fair demand for shingles at Boston and the outlook for trade during the balance of the present season is good. Sales of good brands of white cedar extras are reported lately at $3.55, and few good makes, if any, can now be had at less than $2.50. Clears are bringing from $3.10 for poor ones, up to $3.30 for the best. Most of the current business is on a basis of about $3.20. There is a fair trade in red cedar shingles at about $3.85. The lath market is quiet, many retail yards appearing to be well stocked.

United States

Reports received from many lumber producing sections of the United States indicates that the railroad companies are again coming into the market and placing heavy requirements. They are specially active in their demand for ties, ordering more than they have for many months past. It is also reported that the French Government are in the market for six million yellow pine ties. A heavy curtailment movement has been inaugurated throughout the south, reducing the output by more than 25 per cent. Heavy storms and floods in the gulf coast and south Atlantic districts have also increased the curtailment. Prices in general have not come back to their high point of a few months ago when the decline started, but apparently the downward tendency has been checked and the move is now in the other direction. The strike of longshoremen and dock workers on the Pacific coast for the purpose of introducing the closed shop, irrespective of the fact that they are highly paid for unskilled labor, has almost put an end to coastwise lumber shipping in Washington and Oregon.

Northern pine mills report a good demand and that practically all stocks in shipping condition are moving out. Northern hemlock and hardwoods are in a similar situation. At Chicago, the northern pine trade shows no change. The demand is only fair, being best for the lower grades for box manufacturing purposes. There is a moderate business in Norway and spruce. At Buffalo, the demand for northern pine is smaller than it was a few weeks ago, largely on account of the holiday season. The best demand is for the lower grades and prices are holding firm. The demand for northern pine at North Tonawanda is less active. Some of the docks are piled with stock which it has been impossible to move on account of unsatisfactory labor conditions. Some dealers are considering the advisability of bringing in negro labor. There is not much change in the hemlock situation at Chicago. The best demand is for merchantable and No. 1 stocks. It is expected that the improved crop situation will stimulate the demand for hemlock from country yards. At North Tonawanda, the hemlock market is not so strong as it was earlier in the season. Prices are unchanged. The hemlock market at Buffalo continues firm, especially for the better class of stock.

Hardwoods at Chicago continue quiet and are expected to remain so during the rest of the midsummer season. The outlook is good for an active fall trade, both in northern and southern stocks. There is a good demand for fancy woods, such as walnut and mahogany, which are moving at good prices. The leading item of northern hardwoods is still birch. At Buffalo, the best market in hardwoods is for mahogany. Plain and quartered oak are rather neglected and prices are easier than they were a few weeks ago. There is a fair demand for maple and ash, especially in thick stock, and prices are holding firm. There has been a general seasonable decline in trade.

Great Britain

The latest reports from Great Britain tell of a considerably lower basis of prices, both in the c.i.f. and spot markets. The general feeling, as a result, is that trade has reached a much safer level. Unquestionably there is a better tone than during the past few weeks. Nevertheless, although values are far below what they were a short time ago, they are still high enough to permit of further large drops in price per standard, and this risk, although not considered to be a really immediate one, is always present. Apparently the war situation is regulating the volume of trade very closely and the possibility of important changes in the military situation is inducing the majority of the trade to play safe and not tie themselves up with large commitments until the future appears more definite.

Arrivals on consignment are not depressing the market in Great Britain at present. Many of the vessels recently chartered on speculation are being diverted to other markets. C.i.f. prices continue to show reductions, following the course of the freight market pretty closely. The situation in connection with Swedish battens is an interesting example. In March and April good stock of this kind from the lower gulf was valued at about £30 per standard. Buyers can now import for about £5 per standard less, and yet are not eager to purchase. As to the permanence of the drop in price, many opinions prevail. As a matter of fact, a depression in spot prices is generally

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

felt at this time of year when the first arrivals of Baltic and White Sea stocks come upon the market.

Deliveries at London docks continue fairly good, but do not represent the actual quantity going into consumption. Apparently yards are storing considerable holdings on their own premises. Consumption is practically all for special purposes connected with war work, the building trade having practically disappeared and municipal requirements being reduced absolutely to the minimum. Stocks in London at the end of June showed very few changes as compared with those of a month previous. Forward buying at London is slow and is not expected to improve until the freight situation becomes clearer. At Foy, Morgan & Company's latest auction sale 3rd bright Ottawa yellow pine from Montreal, 3 x 11 in., 12 to 16 ft., sold at £30 5s. Third bright Ottawa spruce from Montreal, 3 x 10 in., 9 to 16 ft., sold at £27 10s. Unsorted spruce from St. John, 3 x 9 in., 3 to 18 ft., brought £25 10s. Hemlock from Halifax 3 x 9 in., 8 to 16 ft., sold at £21 10s, and another lot of 3 x 7 in., 7 to 17 ft., from Halifax, brought £19 15s.

At Liverpool, the trade situation has been disturbed by the drop in freights. The demand has fallen greatly. The spruce market is not so steady, although the demand is still fairly strong. The supply, however, has exceeded the demand and stocks are heavy. At Manchester, prices are a bit easier, especially for soft woods. Spruce is selling at £30 for 7 in. and 8 in., and about £32 10s for 10 in. and 11 in.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Trade—No English Buying

St. John, N. B., July 21; (Special to the Canada Lumberman):—During the past two weeks practically all sales and shipments from this port have ceased. The English buyers refuse to purchase any deals for future delivery at any price, preferring to wait until the freight situation clears up; until such times as a stationary rate will be established. This may occur in the near future or may be delayed for some time. The war will regulate this question entirely. Stocks of deals on the other side are said to be heavy with little or no business offering. A considerable quantity of deals are held here by the shippers, and no shipments being made causes the stocks to increase rather than decrease. All the shippers have many millions piled in lighters, which deals come into St. John on cars from interior mills and are loaded from cars to scows as the owners cannot afford to pay demurrage on cars. It is said that at least ten million feet are piled in lighters awaiting shipment, besides the stocks piled at mills on wharves. No price can be quoted. There is none.

Locally, the market is extremely dull, very little building is being carried on and carpenters are complaining that there is very little work to be had. What the balance of the year has in store remains to be seen. Prices for low grade stocks are easier. Large quantities of refuse are held here and all along the north shore. Factory prices are unchanged, but many times it is said of late they are shaded.

Laths remain as unsteady as long lumber. Shingles are unchanged as far as the local manufactured article is concerned.

The American market is very unsteady but is said to have regained slightly from its slump of ten days ago. War troubles seemed to have caused very much uneasiness with our friends below the border, but now that the question has been set aside, a better feeling should arise, and as hot weather changes to cooler, a stiffening of prices should be felt. The present prices which are being offered for American goods would not leave any profit to the shipper at St. John whose logs, in fact, cost more than the sawn lumber would now leave.

The slackness of the market now being felt here will no doubt be of short duration; at least we hope so.

Logs are coming forward out of booms in goodly quantities, the rafting operations should be finished by the middle of August, about two-thirds of the cut of logs have now been rafted.

Improvement Noted in Montreal Trade

Montreal, July 26.—(Special to the Canada Lumberman.)—A slightly better demand for local account is in evidence, and from now until the fall this condition is likely to continue. Several lumbermen look for a decided hardening in values later on, basing their opinion on the view that the next cut will be considerably restricted owing to the shortage of labor, while the advance in wages, camp supplies, etc., will have a material influence in increasing the cost of getting out lumber. A large number of men hitherto available for lumbering have joined the colors, and those who remain can command a substantial increase in wages. Montreal companies not connected with the lumber trade report that it is very difficult to secure men, owing partly to the inducements offered by the concerns making munitions and partly to the scarcity of foreign labor.

Some good orders for British Columbia fir for the Maritime Provinces have been placed in Montreal.

The sash and door business has picked up a little. Box makers, too, are fairly busy. An order for 30,000 nine-pounder boxes has been given out here, and the Imperial Munitions Board offered further and larger orders, but at such prices that the contracts were refused. Some firms have learned by experience that there is no money on the basis offered by the board; and, with continual rises in the price of hardware, etc., the chances are that a loss will be incurred. Manufacturers want the business, but they decline to take it on values which are below actual cost. In some instances, where contracts have been let at absurdly low prices, makers have, it is stated, fallen down, and the orders have had to be replaced at higher rates.

Shipments to the United Kingdom have been restricted owing to a break in the Lachine Canal, preventing barges from reaching the harbor. Repairs were rushed, men working day and night. Rates have shown an upward tendency, being in the neighborhood of 300s. per standard. So far tonnage has been more abundant than was generally looked for, and it is now announced that the Government has released three more vessels—the Northland, Southland, and Canada, of the White Star Dominion Line—which have been engaged for many months in the Mediterranean service.

The pulp and paper sections are again buoyant. Many enquiries for sulphite cannot be entertained on account of supplies having been sold for a long time ahead. Prices for such pulp as is available are very high. Ground wood is also a strong market, and there is no difficulty in selling all the production. News print contracts are being renewed at advancing prices. The demand is excellent, and indications are in favor of this condition prevailing for many months. There are, of course, contracts running at a comparatively low level of prices, but those which are terminating can only be renewed at the higher values now existing. One result of the active market in pulp and paper is the building of other mills, which will come into operation next year. The Canadian pulp and paper industry is expanding at a good rate, especially in the Province of Quebec, and 1917 will see a substantial addition to the output.

Shipping Activity at Parrsboro

Parrsboro, N. S., July 21; (Special to the Canada Lumberman):—During the past fortnight a Norwegian steamer and two tern schooners have sailed from this port for the United Kingdom with cargoes of deals and scantlings aggregating 2,860,490 feet. Within the same period three schooners sailed for United States ports with lumber. Their cargoes comprised 493,850 feet of spruce and hemlock boards and scantling and 165,000 laths.

A steamer and a ship (both Norwegian) and three tern schooners are now loading deals here for trans-Atlantic ports. They will carry about six million feet.

The four-masted schooner being built at Port Greville will be launched about the middle of August. The other schooners along shore will be later getting off, but will all load for the United Kingdom.

Glasgow Market Report

Cant & Kemp, Glasgow, Scotland, in their quarterly timber market report, under date of July 4th, say:

The quarter now ended marks a distinct change in the conditions which have prevailed since the war began. The eagerness of buyers to purchase goods arriving—which has been a marked feature for some time past—has now practically ceased. The uncertainty of the freight market is the cause of this change. Lower freights have been accepted recently by shipowners, and buyers are no longer purchasing freely, as they feel that the risk of further freight reductions compels them to purchase only from hand to mouth. Business is consequently very difficult, and, until the freight position becomes clearer, is likely to remain so. The consumption of all classes of wood goods is practically confined to direct or indirect Government requirements, as the high costs do not permit of ordinary work being carried on.

In spite of the prohibition of hard woods, the goods which have been shipped prior to the date of the proclamation, and now arriving, are meeting with a slow sale. Consumers were well stocked, and

Company, Limited

Manufacturers of Lumber

Extensive New Brunswick and Quebec timber limits, abundant with Virgin Spruce, Pine and Hardwoods.

Twenty years' experience in Milling and Manufacturing, together with a practical knowledge of Building and Architecture, is why our Customers tell us that the Dressing, Grading, and Manufacture of our Stock is just a little better than they expected.

Large stocks of 1 in. Spruce Lumber always on hand.

Try a car of our Air-dried Dressed Spruce.

We also make a Specialty of Kiln Dried Stock.

Our personal attention given to every detail.

Write, wire or phone us for quotations.

Established 1894 ***Incorporated 1908***

Campbellton, New Brunswick

have now to contend with a shortage of employees through enlistments.

Shipbuilders continue well employed with Government work, the result being that for the half-year just ended the total launches for the Clyde amounts to 16 vessels, measuring 58,063 tons, as against 129 vessels of 267,677 tons for the same period in 1914. The yards, however, are all busy, and a good number of enquiries are reported for mercantile vessels. Wagon builders have been very busy on repair work, but no new orders of any account have been placed for rolling stock. Any parcels of wagon oak planks arriving meet with a ready sale at good prices.

Quebec Waney boardwood.—Stocks have increased, but the enquiry is very limited, being next to "nil."

Quebec red pine.—The stock of timber is "nil." The small stock of deals is sufficient for the present demand.

Quebec oak.—The stock is very much reduced. High prices can be obtained for first-class parcels.

Quebec elm.—The stocks are light and values rule high. Good parcels would meet with a ready sale.

Ash.—The stock is not heavy, but quite ample for the demand. Quotations are: 5/6 to 6/6 per c. ft. for first-class parcels of logs, and from 4/ to 6/ for planks and boards, according to quality and specification.

Birch.—The stock returned is light, but considerable quantities have arrived, which do not yet appear in this return. The demand for consignment parcels is weak, as buyers have mostly contracted for their needs, and are not inclined to buy at present prices. Quotations are: Logs, 4/6 to 5/6; planks, 3/6 to 4/ per c. ft.

Quebec yellow pine deals, etc.—The stocks are much heavier, and chiefly in brokers' hands. The demand is very restricted, and shipper's prices are not easily obtained. Quotations are: Firsts—Broads, 6/6 to 7/; regulars, 6/ to 6/3; undersized, 4/9 to 5/. Seconds—Broads and regulars, 5/ to 5/6; undersized, 4/ to 4/3. Thirds—Broads and regulars, 4/ to 4/6; undersized, 3/8 to 3/10½. Fourths—Broads and regulars, 3/9 to 4/; undersized, 3/6 to 3/7; good sidings, 5/6 to 6/6—all per c. ft., according to specification.

Quebec spruce deals. — The stock is much increased, but the demand has fallen off. Quotations are: 9-inch and up, 3/10 to 4/2; 8-inch and under, 3/5 to 3/9 per c. ft.

Lower port pine and spruce deals.—This stock is also heavier, and quotations are: 9-inch and up, 3/8 to 4/; 6 to 8-inch, 3/3 to 3/7 per c. ft.

Liverpool Trade Conditions

Smith & Tyrer, Ltd., Liverpool, Eng., in their monthly market report, say:

Hardwoods.—Prices are well maintained, and stocks are getting low. Spruce deals have suffered a setback owing to the reticence of the buyers. The serious fall in freights has contributed largely to the weakness of the situation. Hemlock is difficult to move. Birch, both logs and planks, is very slow; and, although the prohibition on planks has been provisionally withdrawn, there is no revival of the demand. Pine, notwithstanding light stocks, is weaker. Pacific Coast woods.—Although more space is available, business is on the dull side.

London Market Report

Churchill & Sim's' wood circular, under date of London, July 5th, says in part:

The month's importation to London has been about on the lines of the 1915 totals, except that, from the White Sea, shipments were accelerated this season owing to the number of steamers loaded over the ice in the late winter and early spring months. In spite of a somewhat increased supply, there has been no great addition to the stocks stored in the London docks, deals being still in small compass, while battens and rough and prepared boards are rather more plentiful. The demand has been none too satisfactory, and the total deliveries from the port for the half-year show a decline of some 13,000 standards, of which June is responsible for 3/4,000 standards. Circumstances have combined to make importers very chary of committing themselves to further purchases, even at the lower prices now current, the principal factor being undoubtedly the decline in the Swedish rates of tonnage and the disappointing volume of enquiry for stock.

From the St. Lawrence there has been imported: Pine deals, 39,000 pieces, against 16,000 pieces in 1915; spruce, 287,000 pieces, against 126,000 pieces in 1915; birch planks, nil, against 6,000 pieces in 1915; and from New Brunswick, etc.: Pine deals, 4,000 pieces, against 3,000 pieces in 1915; spruce deals, 328,000 pieces, against 1,134,000 pieces in 1915; birch planks, 28,000 pieces, against 50,000 pieces in 1915.

A few pine deals have arrived, but there is little change in the position of the stock, and prices have only been slightly affected by the general apathy of the demand. Some large quantities of red pine were sold during the month, at values which showed some weakness, directly traceable to the lower quotations which the decline in freights has made possible. The supply of spruce to the London market was only about one-third of the 1915 total to date, but prices are lower and buyers nervous of further weakening in the immediate future. This may cost to pass, but the position will want careful watching, the general position of whitewood being a strong one, and tonnage demands in other trades may, at any moment, completely alter the complexion of the market.

Liverpool and Manchester Stocks

The following report upon Liverpool and Manchester stocks for the month ending June 30th, 1916, is furnished by H. W. Lightburne & Company, Liverpool, and their St. John, N. B., representative, John E. Moore & Company, Ltd

Salesmen's Hotels, Expenses and Wages

In the earlier days of lumber salesmen, except in a few of the larger cities, there was usually but one place in a town providing accommodations for travelers, and many of them were undeservedly dignified with the title of hotel, as frequently the soft side of a board would be about as comfortable as the mattresses and pillows, and the meals served were not such as the most vivid imagination would picture as marvels of excellence.

You would sometimes reach a small town late at night in the winter season in the North, as I have, to be ushered into a cold sleeping room with no means of heating it (unless perchance the chimney or stove pipe happened to pass up through it), with only an old-fashioned washbowl and pitcher standing on a small stand or commode, a little mirror hanging over it, probably badly cracked or broken in several places, a bed, and usually one very uncomfortable chair; and you disrobed by the faint and flickering rays of an old, ill-smelling oil lamp. On getting into bed you felt you had enough blankets and comfortables over you to prevent your ever getting up without help; but you eventually got warm enough to fall asleep. In the morning you found your moustache frozen to the bedclothes, and on arising, after a hard struggle with the frost and the load of bedding, you also found the water in the pitcher frozen so you needed some kind of a weapon to break the ice before you could perform your morning ablutions.

All of this you obtained for 50 cents, and you felt like charging it up in your expense account at about four dollars. Your breakfast would sometimes cost you two bits and sometimes a half-dollar; frequently it was dear at either price. In those days lumber salesmen had to be rugged and strong physically and their digestive organs always in good working order. Gradually, however, conditions changed, better accommodations could be had, and to-day it is only in the isolated and very small places that comfortable hotel accommodations cannot be obtained.

In late years it seems to me too many salesmen seem to think they must arrange their route so they will reach some good-sized city every night, thereby often neglecting good opportunities to obtain business in some of the small places, sometimes referred to as "tank towns." Again, many think they must stop at the best hotel in a city and have a choice corner room, no matter how much it costs their employers, seeming to think such a course is necessary to maintain their standing, prestige, or dignity, when, as a matter of fact, not one in a hundred of those they call on care two whoops which hotel

they patronize or what kind of a room they have, and, in a large majority of cases they can find good, comfortable accommodation for much less cost to their house.

Hotel prices have certainly advanced materially in recent years, most of them now being operated on the European plan which always means a higher cost to the traveling public, and the salesman cannot avoid the greater expense if he would; furthermore, I believe a traveling salesman should patronize hotels where he can get comfortable quarters and good things to eat, because if he is to make a real salesman of himself and become a valuable man to his employers he must be well housed and fed, but he should always bear in mind that his firm pays his expenses and will judge as to his real worth, at least to some extent, by his expense account, which is materially affected by his hotel bills.

Again, by arranging his route so he will be at the best hotel in the larger places every night he may think he will meet more of his fellow-salesmen, have a chance to "swap" yarns with them, have congenial company going to some "show,' or perhaps have a little game of "draw," but if he indulges in that pastime to any great extent, even though the money won or lost may not affect his financial condition, it will mean irregular hours, loss of sleep, usually too much smoking, and perhaps other disconcerting practices which will seriously interfere with that mental alertness so necessary in these days of keen competition, and therefore frequently be the cause of his failure to get the customer's signature "on the dotted line."

A salesman should always be at his best, mentally and physically, if he is striving for and expects good results. Furthermore, he will really find that the most successful salesmen—the ones who get the best pay—will try to get away from all the demoralizing influences mentioned, and will spend an hour or so about every night writing to the general office, giving a report on those they called on that day, as well as any matter of general interest that may have occurred; writing to customers they expect to visit during the next few days, calling attention to some items of stock they know each particular customer uses, especially if something their firm has a good supply of; sending in what orders they secured, accompanying them with full and complete information regarding any that may be a little out of the ordinary and therefore require some special attention at the general office. He will also find that these successful men don't plan to get to the big places every night, and, when they are there, don't go to the swellest hotel in town, but to some comfortable place where they can have every needed convenience at much less expense; nor do these successful men always try to get back to their headquarters Friday night each week, even if there is to be a good ball game Saturday.

A much mooted question among salesmen is how much should be spent on customers by way of entertainment, cigars, etc., with the idea of influencing them to give you more of their business. Personally, I do not believe the average lumberman you call on in your ordinary every day work expects or wants you to do very much along this line; in fact, there has been a marked change in this respect during the past ten or fifteen years, and I believe you will meet with better success in the long run if you sell your goods on their merits, backed up with the character and reputation of the firm you represent and your own personality. During the lumber convention season, when you meet lumbermen attending the meetings of their associations, whether customers or those you would like to sell to, you are then mingling with them on more of a social footing, and at such times it seems more in keeping with the fitness of things to show them some social courtesies and attentions, to what extent and in what way depending on the circumstances, surroundings, and the men you want to entertain.

It is not necessary to be extravagant, but if you possess the happy faculty of doing the right thing at the right time and in the right way, you will secure a strong hold on their friendship and goodwill that will quite likely result in closer and better business relations.

Salesmen's Wages.

The question of "Salesmen's Wages" is a big and a broad one, because there are so many elements entering into a determination as to the real worth of a salesman to his firm.

Some salesmen have the ability to get a big volume of orders, but sometimes only at the lowest market prices, or the lowest they are authorized to make, while others, not so strong on volume, always get the top-notch prices; then there are others commonly classified as "order takers" or "pedlars," who just drift along, seemingly without much ambition to become a real live one.

Undoubtedly the best salesman is the one who is thoroughly conversant with the good and bad qualities of the particular kind of lumber he is selling so he can convincingly recommend it for such purposes as it is best adapted for, thereby obtaining and holding the full confidence of those he sells to and avoiding pitfalls too many encounter by recommending their material as good for all purposes; the one who not only has a complete knowledge of the product he is selling, but who by constant, intelligent study, research, and observation also acquires at least a fairly good knowledge of the competing woods, and likewise secures every bit of information and data he can about the numerous substitutes for wood so he can point out their weak points; the one who thoroughly believes in what he is selling and the firm he represents; therefore, is completely and constantly filled with the spirit of loyalty to his employers and always doing his very best to guard and promote their interests in every legitimate way; the one who is always optimistic and can meet the world with a smile instead of a frown, even when business is dull and orders are scarce. The chronic pessimist never yet accomplished any of the big things in the world, either in commercial or public life. The one who never deems it necessary to "knock" a competitor, but attains one of his chief pleasures in praising the good qualities of the material he is selling; one who is strictly honest, aggressive, of strong and pleasing personality, full of intelligent hard work—in short, a hustler, and who has the necessary nerve to decline an order if price is unsatisfactory or there is anything called for which cannot be furnished by his firm; the one who is conservative in his expense account without being stingy, and who is always alert to grasp every opportunity presented whereby he can bring about better conditions for the trade, his firm, and himself; one who also has the stamina, when investigating or adjusting a complaint, to tell the customer he is wrong, when such is the fact—in other words, to stand for a square deal for both the customer and the mill and to see that both get it, is the salesman who is always welcome and successful.

You may say I am describing a rare "bird," but there are salesmen who possess most of the qualifications mentioned, but I must say in passing you will very rarely find such a one looking for a "job" so long as his employer recognizes his worth and treats him fairly.

Some of the brightest minds connected with the selling end of the business have agreed that to be fair and equitable to the salesmen some kind of plan must be worked out—call it "bonus," "profit sharing," or what you will—that will more equitably recompense the salesmen in accord with their actual worth. The Burroughs Adding Machine Company, the National Cash Register Company, the Dictaphone Company, some of the largest commercial jobbing houses in different lines, and several of the large manufacturers of forest products have adopted some plan along these lines, and so far as I am able to learn, none of those who have tried it have ever discontinued it, although sometimes modifying it as conditions justified. What I have said applies with equal force to the sash and door salesman as well as to the lumber salesman, and everyone is entitled to fair and just consideration when fixing his compensation. If a man in any position is fairly and justly worth more to his firm than he is paid he ought to receive it, and if he is simply an "order taker" he will sooner or later eliminate himself from the payroll of any first-class concern.

It has been well said that "Men are valuable just in proportion as they are willing and able to work harmoniously with others for a common good." There is one other thought I would like to pass along to all salesmen, and that is to always remember that the things that make our business is our reputation among those who can buy our goods. Also remember the result in every industry is a survival of the fittest—that is, the most reliable, the most aggressive, the most efficient.

I think it fitting to close this rather rambling talk with one of Walt Mason's little poems, modified somewhat to fit the occasion, entitled:

The Welcome Man.

"There's a man in the world who is never turned down wherever he chances to stray; he gets the glad hand in the populous town, or out where the farmers make hay; he's greeted with pleasure on deserts of sand, and deep in the aisles of the woods; wherever he goes the welcoming hand—he's

The One Who Delivers the Goods.

"The failures of lift sit around and complain the gods haven't treated them right; they've lost their umbrellas whenever there's rain, and they haven't their lanterns at night. Men tire of failures, who fill with their signs the air of their own neighborhoods; there's a man who is welcome wherever he goes—he's

The Man Who Delivers the Goods."

Bristol's Wood Goods Imports

Imports of wood goods into the port of Bristol, England, for the calendar year 1915 and previous years were as follows:—

	1911.	1912.	1913.	1914.	1915.
Wood Goods—Deals ....Loads	44,411	40,689	28,402	53,759	79,500

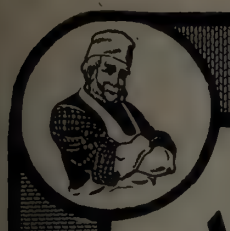
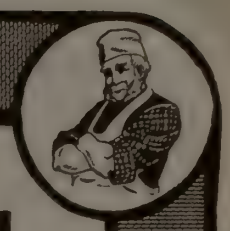
Other kinds ... . "	2,940	1,050	488	594	831
Total wood goods '... ... .. "	47,609	42,424	31,284	54,907	81,531

Lieut.-Col. J. B. White, of the Riordon Pulp and Paper Co., Montreal, is returning to Canada from England in connection with the formation of a second Canadian Forestry Battalion. In a letter from Lieut.-Col. White he speaks of the splendid timber which is now being cut in the Old Country, and also states that the Canadian Foresters have been exceptionally well treated in all parts of the country.





Always Have Good Sweet Bread

You can't get your bread too good for the men. Lumbermen are just as quick to appreciate the fine flavor of

CREAM OF THE WEST FLOUR

The Hard Wheat Flour that is Guaranteed for Bread

as men doing any other kind of work. Try a shipment and give them a treat.

We also make a special line of feeds for horses around the lumber camp. Crushed Oats, Mixed Crush Feed or Chop, that will keep them in the best of condition for strenuous work.

English Market Conditions

A report form Halifax, N. S., says:—"The English market for Nova Scotia lumber continues low. Our deals now secure only between £20 to £22 for spruce, and as low as £17 and £18 for hemlock, Our lumbermen and shippers are now holding off to some extent in the hope of higher prices. Freights are still low and charters are not as frequent as heretofore. Shipments are normal but these are principally on charters which were made when freights were 400 shillings and not 275 to 285 shillings, as now. Whereas in the past shippers had to take steamers at their owners' prices, bottoms in some cases are now offered by the owners, as the lumber people are not anxious to charter for shipments to a falling market. A slight rise in freights can be anticipated for the autumn.

"There is not much business in the American market for our lumber. Freights are still high. Prices paid by American buyers for spruce per 1,000 feet are $20 to $22, according to specification, and for laths per 1,000, $3.75 to $3.85. Sawing is brisk throughout the country. The portable mills will probably finish operations this month, but the stationary mills will operate until the end of September and perhaps later. The English embargo on hardwood planks having been lifted some shipments have been made, but the market is not strong, according to reports.

British Government Wants Canadian Timbers

A despatch from Vancouver, B. C., states that the Government timber office is calling for tenders for 4,000,000 feet of Douglas fir in 12 x 12 sticks and 1,000,000 feet of 3 x 9 in. timber, to be shipped on railroad cars and delivered at the ship's side in Halifax. A large order is also open for the supply of spruce to be used for aeroplane manufacture. Although the British Government is prepared to pay $200 to $225 per thousand feet for the spruce, the order is said to be larger than can be supplied from Vancouver. This spruce is to be cut on the quarter, with the grain at an angle of 45 degrees across the section so as to secure the maximum of strength. In its subsequent manufacture the spruce is made into hollow rods, each rod consisting of two thicknesses of laminated wood, making it both light and strong.

Canada's Foreign Trade in Wood Goods

Canada's imports of wood and manufactures of wood for the twelve months ending April, 1916, were valued at $8,696,065, as against $13,465,189 for the preceding twelve months. The 1916 imports were divided as follows:—from the United States $8,294,666; from the United Kingdom, $151,531.

Canada's exports of wood goods for the twelve months ending April, in 1916 and 1915 were valued as follows:—

Articles Exported	Twelve Months Ended April. 1915.	1916. Total.	1916. To United Kingdom.	1916. To United States.
	$	$	$	$
Logs	1,229,405	1,077,909	45,264	1,032,305

Wood and mnfrs. of—Total	52,764,845	63,540,428	14,972,293	45,160,733

Cuba's Lumber Imports

The quantity and value of lumber imported into Cuba during the fiscal years 1914 and 1915, was as follows:—

Country of Origin	Fiscal Year, 1914 Amount Feet	Value	Fiscal Year, 1915 Amount Feet	Value
United States	129,823,000	$2,240,273	79,719,000	$1,287,412
British West Indies	1,408,000	18,982	2,789,000	26,316
Canada	12,357,000	207,257	13,111,000	236,852
Germany	1,000	52	.....	.....
France	26,000	810	1,000	22
United Kingdom	1,246,000	17,106	1,980,000	21,188
Norway	1,811,000	33,155	.....	.....
British India	220,000	2,947	.....	.....
Canary Islands	4,000	63	.....	.....
Total	146,896,000	$2,520,646	97,600,000	$1,571,790

From the above data it will be seen that while the total imports for 1915 show a decrease of $948,856—as compared with the preceding year—Canadian contribution increased $7,333. The lumber imported from the Dominion is chiefly confined to spruce.

Alfred Dobell & Co.'s Liverpool Report

Alfred Dobell & Co., Liverpool, Eng., in their monthly timber market report, under date of July 1st, say:—

Spruce Deals.—The disinclination to buy is still in evidence, the result partly of a slackening in the demand and partly of the easing in freights—whether the latter feature is not of a temporary nature remains to be seen.

Douglas Fir.—Only small liner parcels have arrived, and practically all these went direct into consumption. There is very little enquiry for forward shipment, nor does the freight situation encourage it.

Trinidad Market Report

Gordon, Grant & Company, Limited, Port-of-Spain, Trinidad, in their market report under date of July 1st, says:—The arrivals since our last, are the Schooner Bessie Whiting with 485,900 feet, and the s.s. Cratheus with 73,000 feet pitch pine. The schooner Gladys B. Smith from Halifax with 103,000 feet N. S. white pine has also arrived. Prices remain firm, and likely to advance, due to the high cost of freights at present ruling.

Jamaica's Imports of Wood Goods

Imports of wood, etc., into Jamaica during 1914 and 1915 were as follows:—

	1914 Quantity	1914 Value £	1915 Quantity	1915 Value £
Wood, White Pine ... feet	899,518	6,746	589,308	4,423

Wood, Hoops and Shooks ...	.....	31,900	42,425	.....

Wilson Bros., Ltd., Announce a Change

Wilson Brothers, Ltd., Collingwood, Ont., advise us that they have entered into an amalgamation with the Collingwood Hardwood Lumber Company and R. Feigehen, and will carry on their business as formerly under the name of Wilson Brothers, Ltd., manufacturing all kinds of interior finish and hardwood veneer doors all to detail, also stair building, and hardwood flooring in maple, beech, birch and oak. Wilson Brothers' hardwood flooring is known throughout Canada for its excellent quality. The motto of the company is "Grade First, Price Afterwards; Not Price First and Grade Afterwards." As a result of the amalgamation the company will be in a position to carry on more extensively the wholesale business formerly done by their new associates. Having their own hardwood limits and sawmill, they will be in a position to quote on and to supply all kinds of building material, bill stuff, and heavy hardwood lumber. Their dry kiln has a capacity of 150,000 feet, which enables them to supply kiln-dried lumber when required. Being manufacturers from the tree to the finished product, they are in a position to save the middleman's profit, which, along with their excellent shipping facilities, places them in an advantageous position in regard to competition.

Conservation of Fish, Birds, and Game

A report just issued by the Commission of Conservation, "Conservation of Fish, Birds, and Game," directs attention to the great value of these resources to Canada. The volume is a report of the proceedings of a conference of the Committee on Fisheries, Game, and Fur-Bearing Animals of the Commission, and contains a fund of information regarding the present condition and the necessity for protection of Canada's fish, birds, and mammals. Canada is taking a prominent part in the international movement for the protection of wild life. A migratory bird treaty between Canada and the United States is under consideration. Through the influence of the Commission of Conservation and other interests bird reservations are being created, where the birds may find safe nesting and breeding places. The fur-bearing animals of Northern and Western Canada are being rapidly exterminated. This is clearly shown by the present report. To secure their more adequate protection, the commission is advocating the amendment of the Northwest Game Act, to place responsibility for its administration upon the Dominion Parks Branch, which already protects the animals in the Dominion national parks. The future of the fisheries of Canada is dealt with in an able manner. That they are of great present value is recognized, but there is also a potential value in our oceanic and inland waters which, upon development, would mean the creation of new industries. To meet this condition the commission is suggesting vocational training and simple demonstration stations for the fishermen, that they may take advantage of the most practical and modern methods of their calling. The report is replete with illustrations applicable to the subject matter.

Coniferous timber has been found to be better suited than any other for the production of ethyl alcohol.

The Graton & Knight Mfg. Co. plant today.

Important Additions to Graton & Knight Plant

In the fall of 1914 the Graton & Knight Manufacturing Company, oak leather tanners and belt makers, Worcester, Mass., decided to commence the erection of the largest addition that they have ever made to their extensive plant. The time was rather unpromising for such extensions, but their foresight has been amply justified by the results. The Graton & Knight Manufacturing Company's business has been steady and solid from the time of its inception, 65 years ago. The company now occupy a plant consisting of twenty buildings which are so joined together that, in the aggregate, they represent one enormous building having over half a million square feet of floor space.

The two latest additions, known as buildings "D" and E," are of concrete construction, and have a total floor area of about 110,000 square feet. These buildings have made it possible for the concern to install some improvements which they had been developing and have also enabled them to increase their production as the business warrants.

The first floor of building "D," known as the new "Beam House," is 225 feet long and 115 feet wide, and has enabled the concern to double its capacity for preparing hides for the initial stages of tanning. The arrangement throughout is designed so as to keep the hides moving in one continuous direction from the moment they are brought to the beam house from the connecting hide cellar. The hides are thoroughly cleaned, soaked, the flesh and hair removed and then sent along to the tan yard. The entire construction is of concrete and steel, concrete floors and walls, vats and pits, and everything possible has been done to promote the convenience and comfort of the workmen.

The three floors above the beam house are 225 feet long and 70 feet wide. The second floor is used as one of the "setting out" rooms. From this floor the hides, after being washed, bleached, split, oiled and smoothed, or "set out" by the latest type of machinery are conveyed to the stretching room located on the floor above. The fourth floor is used by the lace leather department and is equipped with machinery of special construction made and designed by the company.

Building "E" is 225 feet long by 65 feet wide, and is four storeys high. The first floor is used for storing hides. On the second floor is located the electrical department and the extensive supply room. The third floor is used as a general maintenance department with carpenter, machine and pipe fitting and stock rooms, where belting strips are sorted and matched and where an extensive stock of finished leather is maintained.

The company have also put up a number of smaller buildings during the past year. A completely new heating and power plant has been erected.

The buildings, although of fireproof construction, are equipped throughout with a sprinkler system and there are innumerable fire doors, staircases and fire extinguishers throughout. The employees are provided with plenty of light for their work, over 40 per cent. of the total wall area being of glass.

The search for new uses of wood is widespread and far-reaching; but the Turks have scored last. The army which they sent to Egypt to fight British and colonials at the Suez Canal was supplied, in part, with wooden bullets. They had been painted a metallic lustre, and the unfortunate soldiers doubtless supposed the cartridges were standard. We captured large quantities of these wooden pegs which passed for bullets when they came from the contractors' factory. The poor Turk gets it coming and going!

Ontario

The Cutler Bay Lumber Company have withdrawn their office from Massey, Ont., and will not operate in the woods during the coming winter.

Plans are in progress to rebuild the planing mill belonging to F. C. Smith, Harrow, Ont., which was recently destroyed by fire, at a cost of $10,000.

The basket factory belonging to Bibby Bros., Dundas, Ont., was recently destroyed by fire. The amount of the loss is not known. The owners will rebuild.

Mr. A. D. Little, the well-known commercial chemical expert of Boston, Mass., reports that a large paper mill will be erected either at Port Arthur or Fort William by prominent manufacturing interests with whom he is associated.

Work is about to start on the erection of a sulphite mill to cost $200,000 for the Ontario Paper Company, Thorold, Ont. W. J. Trimble, Thorold, Ont., is the general contractor. The plant will include two towers, each 116 feet high with elevators.

Further particulars are now available in regard to the sale of the Hope Lumber Company's plant and limits, which was announced in our issue of July 15th. The property has been purchased by the Hope Operating Corporation, which is composed of G. A. Mitchell, of White, Gratwick and Mitchell, North Tonawanda, N. Y., president; Jas. J. McFadden, of McFadden & Malloy, Renfrew, Ont., vice-president; L. S. DeGraff, of A. Weston and Sons, North Tonawanda, treasurer; and Jas. L. Crane, of White, Gratwick & Mitchell, North Tonawanda, secretary. The Corporation was organized in June last with capital of $1,250,000. We understand that the price paid for the property was in the neighborhood of $750,000. The deal includes the transfer of the sawmill at Thessalon, logs on hand, and three timber berths which, it is estimated, will furnish a cut of 25,000,000 feet of white pine annually for eight or ten years. The main office of the company will be at North Tonawanda, N. Y., with a branch office at Thessalon, Ont., and logging office at Dean Lake, Ont.

Eastern Canada

The Belgo-Canadian Pulp & Paper Company, Limited, intend to open a retail branch at Shawinigan Falls, Que., for their lumber and sawmill department.

The sawmill and machinery belonging to D. Audet, Magog, P. Q., were recently destroyed by fire, incurring a loss of $8,000. There was some insurance.

The Smith Lumber Company, Woodstock, N. B., have resumed operations at their mill, after having been closed down for a time in order to remodel the plant.

C. A. Spencer, Limited, wholesale lumber dealers, Montreal, have opened a yard at Mile End, Montreal, for the purpose of sorting lumber in transit. The company recently moved to much larger offices at 500 McGill Building.

A fire at the sash and door factory of Paul Demers, Van Horne and Waverley Streets, Montreal, resulted in damage to the shavings room; damfire started in this department, which is situated near the boiler room; damage was caused by fire and water, and this is now repaired. The loss was covered by insurance.

Western Canada

The Congo Lumber Company's yard at Avonlea, Sask., was recently destroyed by fire.

Wake Bros., lumbermen, Minnedosa, Man., have sold their business to the Valley Lumber Company.

The lumber mill belonging to the Scrim Lumber Company, Vancouver, B. C., was recently destroyed by fire. The loss is estimated at $10,000.

The Alberta Lumber Company, Vancouver, B. C., will erect a two-storey mill building at Vancouver. The building will be 210 feet long by 50 feet wide and the estimated cost is $100,000.

The Canadian Exporting Lumber Company, Limited, has been incorporated with head office at Victoria, B. C., to carry on business as timber and lumber merchants, sawmill, shingle mill and pulp mill owners, loggers, etc.

The Roy & Moffatt Logging Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $10,000, to carry on business as loggers, shingle manufacturers, timber merchants, sawmill proprietors and timber growers.

The Manitoba Power, Pulp & Paper Company, Limited, Winnipeg, Man., have plans nearly complete for the erection of a sawmill, pulp and paper factory and electric plant, at Grand Rapids, Man., to cost $2,000,000. Surveys are now being made for sites. The sawmill will be put in this year and the

pulp and paper plants will be put in next spring. The capacity of the pulp and paper mills will be 100 tons a day. Mr. D. B. McDonald is interested in the company.

The plant of the East Kootenay Lumber Company at Jaffray, B. C., was destroyed by fire on July 16th. The planing mill and timber yards were saved as a result of a rain storm which came at an opportune time. The loss includes five C. P. R. box cars and the sawmill.

The Capilano Cedar Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $10,000, to carry on business as manufacturers and dealers in sawlogs, timber, lumber and wood of all kinds, timber merchants, sawmill owners, loggers, etc.

B. Jahn, a Hindu, who has been operating a shingle mill at Sperling, B. C., has commenced the erection of a sawmill at the same place. He expects to have it in operation about the middle of August. The mill will turn out about 20,000 feet daily and will be operated chiefly on spruce and hemlock.

Sealed tenders are being received by the Minister of Lands for British Columbia, until August 9th, 1916, for the purchase of License X485, to cut 1,490,000 feet of cedar, hemlock, balsam and spruce and 510 poles on an area adjoining Lot 780, Gilford Island, Coast District, Range 1. One year will be allowed for the removal of the timber.

The Retail Lumbermen's Purchasing Agency, Limited, has been granted an extra-provincial license to carry on a general lumbering business. The provincial office of the company is at 704 McIntyre Block, Winnipeg, Man., and the head office is at the Credit Foncier Building, Vancouver, B. C. Henry K. Agnew, Vancouver, B. C., is attorney for the company.

It is estimated that 200,000 people from the United States annually visit the Canadian National Exhibition.

Mr. H. J. Tetreau, formerly secretary-treasurer of the Papineauville Lumber Company, Papineauville, P.Q., has been appointed assistant manager of the Eagle Lumber Company, Montreal.

Experts of the Forest Service estimate that the farm woodlots of the United States contain from two hundred to three hundred billion board feet of lumber and from one to one and a half billion cords of wood.

On July 22nd the steamer Matatua, owned by Shaw, Saville & Albion, Limited, of London, 6,488 gross tons, which left Quebec with a cargo of 5,100,000 feet of spruce for overseas, ran ashore in St. Mary's Bay, on the Newfoundland coast, during a dense fog.

Canada's exports of forest products for the month of May during the last three years were valued as follows:—May, 1916, $4,174,038; May, 1915, $3,487,103; May, 1914, $3,296,455. During the twelve months ending with May the exports of forest products were valued as follows:—1916, $52,316,834; 1915, $42,896,032; 1914, $43,054,053.

A British Columbia official who is in close touch with the logging situation reports that there is an ample supply of logs on hand for the present season, and more are being cut than can be used. He did not expect any general curtailment of production in the logging camps. The good crop reports from the Prairie Provinces had removed the temptation to reduce the output of logs.

Receipts from the United States national forests for the fiscal year 1916 reached the high-water mark of approximately $2,820,000, according to figures just compiled. This is $341,000 above the 1915 total, which, in turn, exceeded any previous year. Officials say that the gain was due to increased demand for all classes of forest products. There was a decided growth in the revenue from all sources, the largest being that of $203,000 in timber sales.

The E. B. Eddy Company, Hull, P.Q., has decided to eliminate the three small chimneys which were formerly used as smoke escapes at the plant. Instead the waste and smoke will be taken off by a chimney which will be built to a height of 125 feet. Construction has been commenced. There have at various times been complaints on the part of citizens of both Ottawa and Hull in regard to the sulphite fumes which pervade the air when the wind is favorable.

The manager of a large manufacturing concern at Vancouver, B.C., in a recent interview about trade conditions, said: "The volume of business which we did in the first five months of 1916 was 300 per cent. greater than that of the first five months of 1915. Trade conditions at present are good, and all the indications are that they will continue good for some time to come. Most of the mill men I know have told me within the last few days that they are stacked up with orders which will keep them busy for six months at least." Referring to conditions on the prairie, he showed a letter from an agent in Winnipeg to the effect that the crop situation was good and a strong demand for lumber was expected to develop, which would warrant an advance in lumber prices.

We handle

Everything in Lumber

We can offer at very attractive prices, if interested, the following:

50 M 1" No. 1 Common & Better Birch
140 " 1" Good Pine Sidings
50 " 1½" No. 3 Barn & Better Strips
80 " 3"x11" Red Pine
42 " 1" A. Sidings

Selecting Factory Lumber

By T. C. James

To many who have made a study of machine wood-working from the technical side, as pertaining to machine work itself, it may sound odd for a man to come along and assert that half the battle for success in machine wood-working depends on selecting the stock that is to be worked; that is, on the selection and buying of lumber for factory and mill work. The buying of factory lumber is generally done by the office end of the institution; in some plants the men that work the lumber are never consulted about it. In others, however, they are consulted and asked for advice about how this or that kind of lumber will work up, or how this grade works or the other grade. If both ends of the business work properly together, the purchasing department will give due consideration to the welfare of the machinery department in buying stock.

There are several cases that have thrown some peculiar sidelights on this subject. On one occasion the lumber being used in a factory was very easy and nice to work, but it became scarce and so high in price that the management desired to try substituting a lower grade. A car or two was purchased for experiment, and created a storm of protest from the men handling the lumber. It was harder to work, harder to nail, heavier to handle, and more disagreeable generally; almost every complaint imaginable was dinned into the ears of the purchasing department.

Mixed in with this din, however, was very little specific, supportable complaint against the substituted lumber; the complaint was that it disarranged and altered the work. It seems, however, that the lumber really gave fair service and was eventually used, and the people working it got over their prejudice against it. In this case there was a certain amount of unreasonable prejudice by the men doing the work; they didn't show due consideration for the welfare of the institution by regarding the fact that there was a chance to save several dollars per thousand by making the substitution.

There are other instances where the office end and purchasing department show fully as much disregard for the men at work. When they go out to buy lumber they buy it either because it is cheap, because they have a fad for certain things, because they like some traveling salesman, or for various causes other than a proper consideration for the men working the lumber.

What many wood-working plants do, and what every one should do, is compare notes and combine interests, that the lumber may be bought at the lowest practical cost, to give the best returns and work up to fair advantage without being unreasonably burdensome on the men doing the work. The importance of this point is emphasized, too, because of the fact that the great burden of the lumber is in low-grade stock, and everybody is striving for ways and means to utilize this stock advantageously in planing mills and factories and get enough out of it to justify working it out.

That is one of the important considerations, and, in connection, it is a wise man or combination of men that can figure out just what lumber will work best in a given factory; not only what specie and what particular grade of wood, but also there enters a consideration of the nature of the defects that cause the lower grades and their relation to the work. There also enters some matters of width and thickness and general working up to get the lumber in such shape that it will fit in best with each factor of the work.

One of the prominent manufacturing concerns of the country, that utilizes a good many million feet of lumber a year, maintains a number of sawmills of its own. Talking on this subject one day, the manager said they didn't operate their own sawmills because they could produce lumber cheaper than they could buy it or because they expected to make money directly out of the sawmills, but quite largely because with their own mills they could have the lumber cut and trimmed to just such sizes and shapes as would work best in their factory, something they found impossible in connection with the average sawmill from which they bought lumber. This pertained not only to dimensions, but to methods of sawing; also to the kind of defects that might be trimmed out and left at the mill instead of being shipped to the factory, thus saving freight.

One day a bright traveling salesman developed an idea which he has used industriously to good advantage, and that was to study the requirements of the different factories and also study the products from the different mills he represented. Pretty soon he discovered that probably one factory could use the low-grade lumber from the one sawmill to much better advantage than another, because of the nature of the defects. Some of the defects rendering it low-grade were such as practically ruined it for one factory, whereas the defects in the lumber from another mill could be trimmed out and a much larger percentage of it utilized.

Right here in this idea is the keynote for selecting lumber. One should study the products from the different mills when opportunity offers, and observe the nature of the defects that cause the low-grade and how well they work out in the factory. That is, how much of the stock can be utilized after the defects are trimmed out. Of course it can never be carried out to an ideal point, but it can be made to help a whole lot. One factory may be cutting its stock one way and another factory another, and as a result the kind of lumber most suitable for one may not be suitable for another. By proper selection and conference with the salesmen and mill men supplying the lumber, however, a lot of good work can be done along the line of supplying that which is best for each factory or mill, all within a given grade and specie. This not only benefits the factory and mill, but also helps along the good cause of using up to better advantage the burdening surplus of low-grade lumber.—The Wood-Worker, Indianapolis.

With the Forestry Battalion

A letter recently received from a private in the 224th Forestry Battalion which is operating in Great Britain gives an interesting idea of the conditions under which the Battalion is working. Writing from Stover Camp, Heathfield, Devon, England, the writer says:—"This is a busy camp. There are about 225 men here, all busy doing regular bush work, cutting trees, making logs, and installing a new sawmill. This one is all Canadian made. The mill we are using now was brought from Scotland and is small and out of date. When we get the new Canadian mill running, we will show them how to cut lumber. The trees are not so large as in Canada, but are good enough for making ties. I like it fairly well over here, but the climate is not so good as in Canada. It is very changeable, rain and cold and warm, but not often warm. We have had only two warm days since we landed in Liverpool. We are fairly well fed and not worked too hard. We sleep and eat in tents, seven men to each sleeping tent. It is cold here at night, but we have four heavy double blankets each, which are sufficient to keep us comfortable." Stover camp is about ten miles from Plymouth.

Interned Germans and Austrians to Work in Mills

Owners of lumber and pulp and paper mills in Eastern Canada, particularly those in Northern Ontario and Quebec, expect to benefit from the Government's decision to release the greater portion of the interned enemy aliens who have hitherto been confined in camps at Kapuskasing, Ont., and Spirit Lake, Que., as well as other places. Already some 2,000 Germans and Austrians have been released, it is reported, and a considerable proportion of them have found employment in lumber and paper mills.

KLIM

SPELL IT BACKWARD
PURE SEPARATED MILK
IN POWDER FORM
FOR ALL USES
WHERE MILK IS NEEDED

The Canadian Government

knows all about Klim and, therefore, uses it exclusively in all soldiers' camps. Many lumber companies know about Klim and they all insist on having it. Here are six reasons—

Why You Should Use It

Klim is in dry powder form.
Klim is not affected by heat or cold.
Klim is cheaper than fresh liquid milk.
Klim is about half the price of Condensed Milk.
Klim is about a third the weight of Condensed Milk.
Klim has the flavor of fresh liquid milk.

Your Men Will Like It

Does this not prove to you that you should use KLIM the Lumberman's Milk.

Packed in ten pound tins, six in a case, costing $10.20 per case.

A pound makes a gallon.

Your Wholesale Grocer has it.

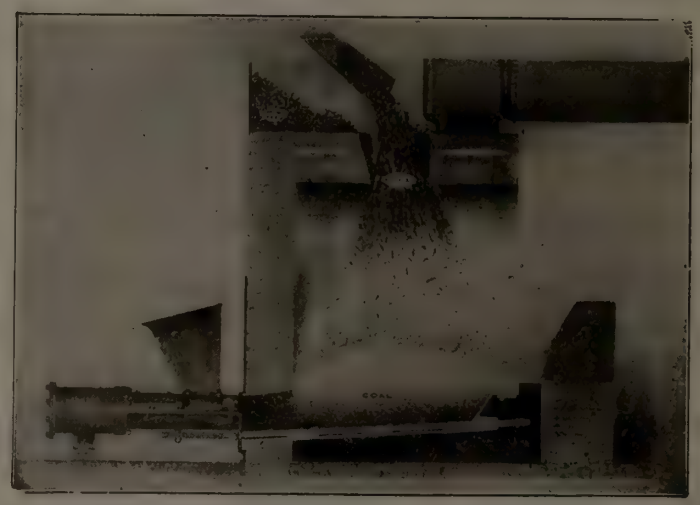
TURN YOUR REFUSE INTO FUEL

The disposal of waste in a saw, planing or pulp mill used to be an item of expense. By the installation of Jones Underfeed Stokers this waste can be used as fuel. The use of the Stoker equipment consumes as illustrated, the refuse and by the mixture of a small amount of coal a steady steam pressure is maintained. If you should run out of refuse or the mill conveyers break down, the change to coal fuel can be made instantaneously without any fluctuation of the steam gauge. One large pulp and paper mill reduced its coal bill 99 o/o with Jones Underfeed Stokers and the utilization of its mill refuse. Every mill cannot make such a colossal saving as this but substantial economy can always be effected with Jones Stokers.

What are the conditions in your mill? Let us talk to you.



Arrangement of Jones Underfeed Stokers in Dutch Oven for burning paper mill refuse in conjunction with coal.

JONES UNDERFEED STOKER CO., LIMITED

National Trust Building, TORONTO

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,
December 20th, 1912.

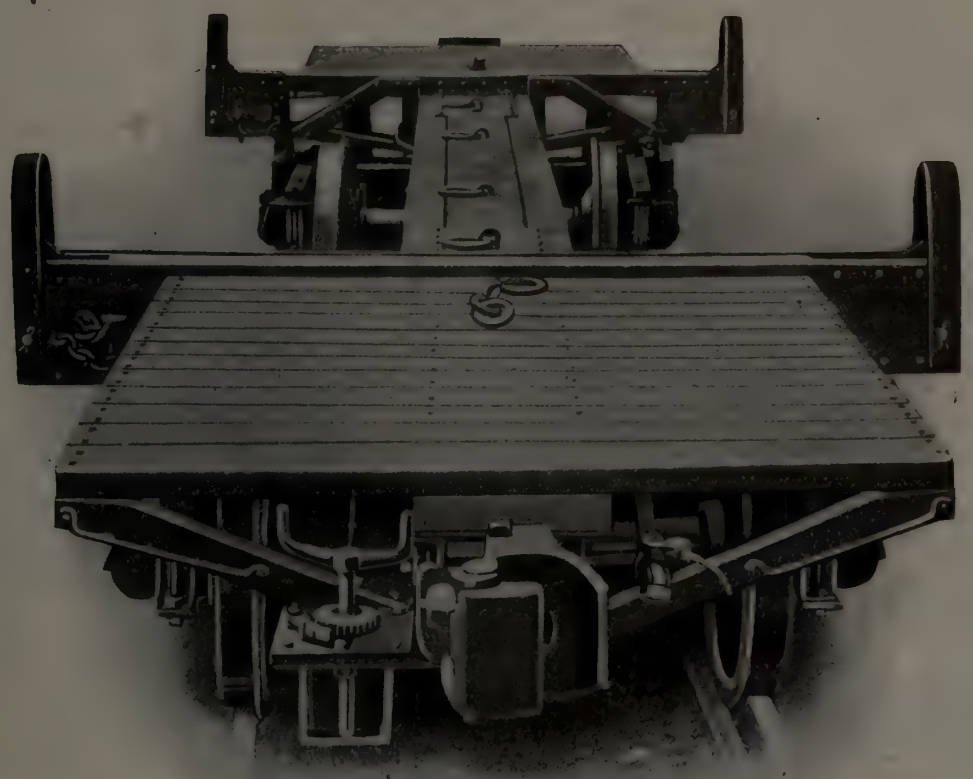
NATIONAL

LOGGING CARS



NATIONAL Steel Logging Cars give exceptional service under all conditions found in the Lumber Industry. We have analysed every known condition of logging and have produced a line of cars that not only give every satisfaction but eliminate every trouble encountered in the safe and economical handling of logs.

The Logging Car Dept. is in a position to give good service on cars of all capacities.

Full particulars supplied upon request.

GOODHUE BELTING

FACTORY TO YOUR MILL

TO the saw mill and woodworking industries we offer an unusually good belting value in our "Acme Waterproof." This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts," then you will buy a "Goodhue.

According to the conditions under which the belt has to run, we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality, but each made for a different service.

Send for particulars and prices **J. L. GOODHUE & CO., LIMITED, Danville, Quebec**

LEVIATHAN OR ANACONDA

LEVIATHAN and ANACONDA have been sold on a "make good" basis for over thirty years. If they hadn't made good we would have been out of business long ago. The fact that our business is progressing rapidly is ample proof of the merit of this belting.

With every belt we guarantee full value in service, dollar for dollar, horsepower for horsepower, and just as we have figured our tables of horsepower for the best results, just so in making the above statement, we not only expect to give equal service, but BETTER SERVICE, AND MORE ECONOMICALLY.

A Leviathan Main Drive in constant service for four years at the plant of the Riviere du Loup Pulp Co.—24 in x 6 ply. No cost of up-keep; the belt has never been touched since the day it was installed.

Why not give us a trial order and let LEVIATHAN or ANACONDA prove itself?

(Continued on page 66)

A SPARTAN is the first belt to operate successfully what is considered the hardest quarter-turn drive in the State of Washington. It is a high-speed drive with only five feet between pulley centres. The belt makes two quarter turns and is called upon to drive the entire planing mill. Previous belts slipped, burned, and soon played out. Spartan has already outlasted any former belt, it runs perfectly true, does not slip, and is still in excellent condition.

SPARTAN LEATHER BELTING

because of its strength, pliability and pulley grip is particularly adapted to the most difficult drives in your plant. Spartan-equipped drives insure greater production and less cost for operation.

Gentlemen:

In reply to your query of recent date regarding service rendered by the 14" Spartan Douole Belt you installed on our quarter turn drive, we wish to say the belt has been entirely satisfactory, and owing to its extreme pliability and friction we feel we have at last secured the right kind of belt for this particular drive.

Yours truly,

DONOVAN LUMBER COMPANY.

Branch Factories:—HAMILTON, MONTREAL, WINNIPEG, VANCOUVER

—He's a Poor Workman

who complains of his tools, as a general rule. But he's a poorer workman who, knowing his tools are inefficient, does not complain.

Educate your men to turn in their files the moment they reach their "inefficient point." That will give them no excuse for poor work.

The cost of the extra files will be much less than the loss in labor, time and mental energy spent in using files that have worn smooth.

Send for a copy of our book, "File Filosophy." It is worth the while of any manager, factory superintendent, shop foreman and workman to read it.

The Famous Five are:

Kearney & Foote
Great Western

MAKERS ALSO OF MANILA ROPE FOR EVERY PURPOSE

FIRE BRICK

Differs in Quality and Variety

For instance, a certain quality or kind of brick that gives satsatisfaction when used in a Refuse Burner, may show up poorly if used in a Dutch Oven.

It all depends on getting the right kind and the right quality for your particular needs.

Just tell us what you want it for, and we'll send a fire-brick that was made for that very purpose.

We Manufacture the Following Well-Known Brands

"Elkco" "Elk Steel," "St Marys," "Keystone" and "Rotex"

Grooves Cut with Huther Bros. Dado Heads

Fits Any Saw Mandrel

A Huther Bros. Dado Head consists of two outside cutters and enough inside cutters to make the required cut. This Head will cut perfect grooves, with or across grain, any width. It is an easy Head to keep in perfect condition, has a simple quick adjustment, and may be enlarged any time after purchase. Sent on approval and if not satisfactory return at our expense.

1103 University Ave.
ROCHESTER, N. Y.

INDUSTRIAL LOCOMOTIVES

A locomotive to justify its cost must start the required load and keep it going.

The right amount of the right material must be provided in the right place.

Each and every part must be sure to fit not only the locomotive for which it was made, but every other locomotive of the same size and design. Spare parts must be instantly available, made so well as to go into place without a machine shop.

We have a number of standard sizes of locomotives in stock and can make immediate delivery.

NO. 40 HEAVY DUTY STEEL SAW CARRIAGE

Long's "Quality" Carriages were the first saw mill machines built by the Company. They were the machines that earned the reputation for dependability in service, that has placed "Long" Machinery in its present enviable position, at the head of its class. There is a "Long" carriage, in a weight, and at a price, to suit every purchaser. Catalogue on application.

The carriage illustrated is our heavy duty 3 block No. 40, the knees of which recede 40" from saw line. The carriage can be furnished in any number of head blocks or axles.

This mark on your saw mill machinery is an indication that your lumber manufacturing equipment is the best and most economical money can buy.

The E. Long Mfg. Co. Ltd., Orillia

"Waterous Forged" Sawmill Chains

Good materials, first class workmanship, and a proper appreciation of what is expected from the chain, is the basis of our chain manufacture.

For these reasons Waterous Chains are especially suitable for sawmill work. Every link is carefully tested during making and before shipment, and great strength and reliability are guaranteed.

For Heavy Duty

For heavy duty we recommend our short and long link Coil Chain built in sizes up to 33 lbs. per foot weight. Our flat and round link Bull Chain also is very useful for operating with log jacks, and on rough wood and refuse conveyors.

We build an all-steel Haul-up Chain on which the largest and heaviest logs can be handled.

These chains are all carefully selected for size and strength so that only ***those most suitable for your work*** will be supplied. This service of selecting the best chain for your use and installing it to give the best results in your mill, is at your command.

We have had fifty years' experience in this work and can give you advice that is worth while.

Chain Accessories

We build sprockets and idlers, drums and end spools to fit any style and size of chain. Our list of extensible tooth sprockets is especially complete. For nice running sprockets that are easy on the chain, we can recommend our make.

Send for Chain Catalogue No. 1081—A post card will do.

Waterous Engine Works Co., Limited

Head Office: BRANTFORD, Canada

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. **Price 30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

"AMPHIBIA"

BELTING

For Difficult Runs

The supreme test—the acid test of belting is on heavy duty machines, over high-speed small pulleys. AMPHIBIA Belting on these runs, as shown above, makes you forget belting troubles, because no trouble develops. The wear is there under all conditions.

Prove it. Try a sample of AMPHIBIA Planer and see for yourself.

ANNOUNCEMENT

TO THE LUMBER RETAILERS AND WHOLESALERS OF EASTERN CANADA:

THE FOREST SERVICE OF THE PROVINCE OF BRITISH COLUMBIA is about to issue a DIRECTORY of LUMBER RETAILERS stocking BRITISH COLUMBIA WOODS and LUMBER WHOLESALERS handling BRITISH COLUMBIA WOODS throughout EASTERN CANADA. This Directory will be for general distribution.

An advance edition is now in the Press and a copy will be mailed to all retailers and wholesalers in Eastern Canada on or about September 5th. This is being done in order that the Directory will be correct in detail and omit no yard or wholesaler dealing in British Columbia woods.

If through an inaccuracy in our mailing list you do not receive the advance copy I shall be glad to forward you one on application.

L. B. BEALE,
B. C. Lumber Commissioner,
Excelsior Life Bldg., TORONTO

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

SATIN-LIKE INTERIOR TRIM

ARKANSAS SOFT PINE
TRADE MARK.

SOFT TEXTURED COMMON LUMBER

Not Only
WHITE ENAMEL
But
STAINED and VARNISHED FINISHES
As Well Can Be Successfully Carried Out On

ARKANSAS SOFT PINE

Being a practically non-resinous wood in the finish grades, it is not necessary to shellac the raw surface, but instead the chosen stain of whatever color is applied **FIRST**, insuring a perfectly uniform absorption. Shellacs and varnishes are then applied and rubbed down.

We urgently recommend machine sanding as against hand work on the bench. All finish should be so worked wherever possible. This treatment in combination with the above method of final application insures a beautiful satin-like surface to the completed work.

Arkansas Soft Pine is properly suitable for woodwork in fine residences, apartments, churches and offices. It is being **NATIONALLY ADVERTISED.** It is identified by a registered trade mark. Its manufacturers **STAND BEHIND IT.**

What better selling arguments could you put to your trade, Mr. Dealer? Better let us quote on your next car.

All stock bearing the Arkansas Soft Pine Trade Mark is manufactured and sold exclusively by the following companies:

Crossett Lumber Company, Crossett, Ark.
Eagle Lumber Company, Eagle Mills, Ark.
Edgar Lumber Company, Wesson, Ark.
Freeman-Smith Lumber Company, Millville, Ark.
Fordyce Lumber Company, Fordyce, Ark.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, August 15, 1916 No. 16

Placing Responsibility for Ontario's Forest Fires

Every time that the Northland of Ontario is visited by a great forest fire, there follows in the daily press an outbreak of absurd references to the causes of these calamities, ascribing them, without consideration of the actual facts, to the carelessness and indifference of lumbermen in not disposing of their slash by modern methods. So long as the press of the country continue to display ignorance of the most elementary principles in connection with this situation, and to publish criticisms of this nature, at the same time failing to note the real neglect that is undoubtedly the greatest cause of forest fires, we may look forward to an almost annual fire loss of a more or less serious nature, and a periodical one which will involve millions in property loss and the destruction of many valuable lives, such as the fire which has occurred this year and that which occurred only a few years ago. The newspapers of the country, both Conservative and Liberal, are at fault in this matter. They are really failing in their plain duty by not facing the situation without considering their political affiliations. Politics, so far as we can gather, are directly responsible for the failure of the Ontario Government to face this problem, and for the inability of the daily press to see it in its real light.

This is a pretty strong statement to make, yet we are convinced of its truth. It is the verdict that we hear from lumbermen of both political stripes and from practically everyone else whom we meet, who comes out of the north country. Since the fire which recently took so great a toll of life and property, we have spoken to many men who are in close touch with northern conditions, and without exception they have all expressed the same views. They say, without the least hesitation, that the cause of the fires is the policy pursued by the Ontario Government in regard to the location of settlers. Men who settle in the north country, particularly in the clay belt, are located at long distances from one another. They are practically isolated, and they make their little clearings in the middle of a forest country. Each of them becomes a serious fire risk for the timber located round about him. A settler has in mind, above everything else, the necessity for getting his land cleared. He works at this, accumulates a large amount of slash and fallen timber which must be got rid of, and fire is the only practical way in which he can handle the problem. He waits until a dry spell has made the material easy to burn and then sets it on fire. He gets his clearing alright, but in many a case he does so at the expense of enormous quantities of timber, and often at a heavy cost in human lives. That is the situation in a nutshell; what is the remedy?

In the first place the desire of the Government to scatter settlement extensively throughout the vast northland, so as to make a good showing in regard to the extent of the country covered, is a mistake. The only way in which such a country can be settled successfully is by grouping the settlers; that is to say, setting aside a fair-sized area at a time and directing all settlement towards it until it is well occupied. This will give the settlers a community interest, such as they cannot obtain if they are scattered about at great distances from one another. The work of building roads will be greatly simplified by such a policy; the settlers will have one another's company, and will be able to co-operate during the season when co-operation is most important; and they will not be so disheartened as many of them must be under conditions which remove them from almost all human companionship. From a business point of view alone, settlement in fairly extensive groups is a better proposition than a scattered settlement. From a fire risk point of view there is no comparison. Scattered settlers are just so many fire risks, and the risk of each one extends over an enormous stretch of country. Grouped settlers clear away a considerable area of land and create, instead of a risk, an extensive cleared area which will act as a fire guard for much of the surrounding forest country.

The fire ranging question is the other important factor in this problem. We often hear it said that the ranging problem is too great to be solved; that it cannot be handled effectively. There is no truth in this statement. It is the excuse of incompetence or indifference. The problem has been solved by corporations and individuals who own extensive timber limits, and there is no reason why the Government should not do the same thing, especially as they have the experience of the timber owners to profit from. There is nothing insuperable about the problem whatever. It is simply a question of organization and the employment of experienced rangers. One large company, owning a vast quantity of standing timber in Northern Ontario, has created a complete fire ranging system within the space of a single year. It has built roads throughout its limits, has placed lookout stations on all the important high points of land and has made it possible to keep a watch upon every bit of standing timber within its limits. If a fire occurs anywhere on these limits, the company learns of it almost immediately and the roads and trails enable the rangers to reach the scene and put out the flames before they become too large to handle. This is practically the whole science of forest fire protection; to get to the fire before it is large enough to do any great damage. The Government can do the same thing if it makes a serious attempt. The universal verdict, however, of all who own standing timber in Northern Ontario is that the Government has not faced this problem and has failed to protect the timber.

We are not trying to make out a case in defence of the timber owner against the criticisms of the daily press. Only those who are not conversant with the situation can utter such criticism. We are trying to show the Government that they are neglecting their duty. Their settlement policy is all wrong. They employ rangers who have little or no experience of their work, according to the testimony of timber owners. The same testimony tells us that these rangers neglect their work, and in many a case are shirkers when the critical moment arrives. We are told that Government rangers are sent up and down the Trancontinental Railway on speeders, to put out fires that may develop from locomotive sparks, but that practically no Government rangers go deep into the bush and guard the Government timber as it should be guarded, nor is there any attempt

to regulate the setting out of fires by settlers in their clearing operations. Moreover, campers, prospectors, and others, who visit the forest areas annually are not followed by rangers to see that their fires are properly set and thoroughly extinguished before the party strikes camp and moves elsewhere.

In short, the timber owners of Northern Ontario find the Government unquestionably guilty of neglecting their duty, and alone responsible for the great losses that are so frequently sustained by the timber owners and settlers themselves. These timber owners have shown the Government how to handle the problem and they are naturally indignant at the feeble manner in which both the present and all former goverments of Ontario have dealt with the situation.

By way of corroborating the view we have expressed above, we draw attention to an article which we publish elsewhere in this issue. This article is contributed by the Canadian Forestry Association, representing a great number of timber owners and public spirited Canadians who are giving their time and thought to the important problem of preserving the timber resources of Canada from exhaustion. Their conclusions, item for item, are in accord with those that we have expressed. In view of all the first hand information that we have received, it seems to us that if there should be an inquest into the death of one of the fire victims, the Ontario Government would have to figure in the verdict as guilty of a neglect that was the direct and chief cause of death.

The Labor Shortage and the Market Situation

Nearly everything that we have heard in the way of discussion about trade conditions during the past month, when calling upon members of the lumber trade, has borne upon the situation arising out of the scarcity of labor. So far-reaching are the effects of this state of affairs that there is not a single corner of the whole Dominion of Canada, in which lumber is consumed, that is not more or less concerned. In northern Ontario the manufacturers are daily wondering how long they can continue operating under present conditions. In eastern Canada the same reports are heard. In British Columbia, conditions are even more serious, as that province today is receiving far more enquiry for the output of its mills than it is in a position to take care of, either in regard to production or shipment.

At the present time, the interest of this condition is confined mostly to its effect upon production and shipment and it is serious enough at that. Before long, the situation will be complicated by the commencement of logging operations in eastern Canada, and by the natural increase in the demand for lumber which is to be expected with the return of cooler weather. The inference is clear that from the present time onward, until some extensive relief is brought about by an increase in the quantity of labor available, there will not be any increase in available stocks of lumber, but rather a steadily decreasing supply, and one which will be taken out of the woods and manufactured at the mills at a much greater cost than has ever prevailed in Canada. The shortage of labor, moreover, is affecting the railway companies just as much as anyone else, and shipments will be much less satisfactory than they have been during the past year.

In view of these circumstances we believe that, without laying ourselves open to the least suspicion of trying to create a demand on the part of retailers and large consumers, we are fully justified in advising them to make a definite point of anticipating their wants to a much greater extent than is usual during normal times. Such a policy will not only ensure them far better service, but will assist the manufacturer.

In connection with the market in eastern Canada for British Columbia lumber, the necessity for anticipating requirements is exceptionally definite as will be realized after reading an interview which appears elsewhere in this issue regarding conditions in the west as reported by a Toronto wholesaler who recently returned from an extensive visit to British Columbia manufacturing points. He reports that the most important effect of the whole situation is the necessity for anticipating requirements on the part of eastern dealers, as they will not be able to get prompt shipments for some time to come. This he ascribes chiefly to the shortage of labor which is curtailing the output of the mills, also to the effect of the labor shortage upon the ability of the railway companies to handle transportation, and lastly the fact that many of the mills of British Columbia, both in the mountains and at the coast have been obliged to curtail their output during the whole of the present year, on account of adverse weather conditions. These weather difficulties commenced with the heavy snow fall upon the coast which stopped logging operations during the early weeks of the year and compelled the mills to shut down for an extensive period. In the mountain districts, very heavy floods which occurred during the spring caused widespread damage to mills, washing away yard equipment, rails, and even mills themselves to such an extent that some of them have not yet been able to complete the repairs. The railway companies in some cases have not even been able to deliver the rails required for renewing tracks that were washed away in mill yards.

While the advice to anticipate requirements seems to us to be unquestionably called for on account of all these conditions, the outlook for trade in Ontario and eastern Canada generally at present does not lead to any definite expectation of an extensive movement of stocks. It will be reasonably easy, therefore, for dealers who have ordered ahead, to handle their business satisfactorily. When we get into the prairie districts of Canada, however, the condition is quite different. Reports all agree that the demand from the prairies is good, and that it will increase. The farmers made good profits last year and now their credit is good enough to enable them to buy anything they want in the way of lumber. Their crop outlook for the present year is also encouraging and we may expect the prairie trade to be good during the balance of this year and during next year as well. The effect of this upon eastern trade will be beneficial in proportion as industry in general in the east is able to keep busy with the limited amount of labor that is available.

Is It Impossible to Improve Trade Ethics?

Why is it that, even in the face of organization among lumbermen, which has made fair progress during recent years, one still hears the same old line of complaint about trade ethics which has always prevailed, and why is it that the number of these complaints does not seem to grow any less? We do not propose to answer this question, because we do not know the answer, except that perhaps the blame may be laid at the door of the "struggle for existence," which is blamed for so many things that go wrong in the business world; or in other words, at the door of the futility of all efforts to raise the moral standard of trade, because of the fact that the individual members of the business community are always changing and permanent improvement through organization and education cannot be so brought about as to hold permanently. It all reminds us of those dreams we often have in which we are struggling vainly to restrain some force, or to do something, or go somewhere, and yet can make no progress whatever. These nightmares come to all of us fairly frequently. In our waking hours, the futility of our efforts to improve the trade situation sometimes seems to be just as great and our failures seem to be just about as complete.

However, having worked off this pessimistic analogy, let us have a look at things a little more closely and see if we cannot do something to help. Getting down to facts, take the case of the retailer in a large city and his relations with the wholesaler. In Toronto, for instance, where the retailers have lately gone quite a distance along the road towards co-operative effort in handling many of their ugliest problems, we would expect to find less complaint about the relations

between retailers and wholesalers than in other trade centres, but now and then we hear some wholesaler break loose with a line of abuse and indignation about retailers that opens our eyes in wonder. If we asked ourselves who was to blame we would find it difficult to reach an answer. A Toronto wholesaler, whose opinions we have always held in pretty high esteem, unburdened himself to this effect a few days ago, in our presence. The retailers in this city, he told us, are just as bad a lot as we know, when it comes to kicking without good ground for complaint. Is this really the case, or was this wholesaler experiencing a periodical fit of the blues? It would be hard to settle the matter, but we do know that at that particular time he was settling a difficulty about a car load of lumber which he had shipped to a Toronto retailer and which he claimed was fully equal to the requirements of the order. The trouble, according to the retailer, was that the percentage of a certain low end of the stock was too great. The wholesaler held that this was not so, and to justify himself to us he explained that the stock had been disposed of for the same purpose elsewhere in the city. Of course, he was at a loss, on account of the cost of shipping the car from one locality to another, and what he said about the retailer would not be fit to print.

We do not care to say that this retailer was not fair in his dealings with the wholesaler, nor vice versa. To get at the merits of the case it would be necessary to enquire into the details of the transaction more closely than we have time for, but we think that we do see where the start of the trouble arose. Assuming that both parties were anxious to do business fairly, which we believe to have been the case, there had been a misunderstanding about the details. To remedy this and to make such troubles impossible, we see no other means than to introduce a more definite and businesslike manner of giving and taking orders for lumber. Far too many orders are put through without the parties to the transaction understanding one another. There is too much dependence upon verbal descriptions and too little general agreement about definitions of grades. Being acquainted with many instances of disagreement of this nature we have tried to become to a certain extent acquainted with the grading of lumber in such markets as Toronto, but we must confess that, after hearing lumbermen dispute continually about the grades, sometimes for hours at a time, without coming to any practical agreement, we have concluded that either our own mind is incapable of appreciating the intricacies of the problem or that there is no possibility of agreement because the interests are fundamentally adverse.

These conclusions are both distasteful to us and we are invariably coming to the further conclusion that, in spite of much discouragement that we have received from some lumbermen, it is possible to draw up in black and white a set of trade ethics regulations and a set of grading rules in connection with the trade of the more important markets, which will eliminate a sufficient number of these difficulties to make the effort more than worth while. We still hope to see this done and to see a better day dawn for the trade, when there will be much less mutual recrimination than there has been in the past. The Toronto trade affords a good starting point for this work. Indeed, a start has already been made, although it has met with a certain amount of indifference. The importance of the matter, however, is sufficiently great to encourage those who are trying to improve the situation, to increase their efforts until they reach a practical conclusion.

After the War—An Immigration Suggestion

We wonder whether it has occurred to the Trade and Commerce Department, or to the Superintendent of Immigration at Ottawa that they have a great force of advertising solicitors now in England, France and Flanders whose services can be utilized to spread information about the attractions of Canada as a land of promise in which to settle after the war. So far as we can remember we have not seen this idea in print, or heard it discussed by anyone, yet when it was suggested to us in a letter from one of our readers, which is published elsewhere in this issue, it appealed to us as one of the most practical suggestions we have heard.

Today, during the war, we are feeling keenly the great shortage of labor of every description and we can appreciate the importance which will attach to the immigration problem after the war when the millions of men who have returned from the front are restlessly looking about for the best land in which to commence again the task of building up homes and providing for their families.

We in Canada think that there is not anywhere in the whole world such a land of promise as Canada, but though we know this and think that we should therefore receive our full share of the immigrants from the Old World, we only have to give the matter a little careful study in order to conclude that we will not even get a fair proportion of this immigration unless we do all that we can to spread among these peoples a knowledge of what Canada holds for them. We will want immigrants after the war as we never wanted them before. The nations of the Old World will probably do all they can to persuade their best young men to stay at home and help to build up their own countries. Everything possible will be done to prevent a stream of emigration from leaving the Old World, and everything possible will be done in other lands to attract the best elements of that stream, which surely will set forth, and to induce them to settle in other lands than Canada.

It is in this light that we view the suggestion set forth in the letter referred to above. It would not involve sufficient expense to be worth while considering, to put such a plan into operation. In fact, with our representatives already abroad, mixing intimately with the very class of men that we will desire to attract, and sharing with them in the struggle for national existence, we have a factor that will be of great assistance, and which, it seems to us, it would be sheer folly to ignore. One only has to give the matter a few moments' thought to realize how great the opportunity is. The intimacy created by meeting Englishmen, Frenchmen and Belgians upon the field of battle, working along side of them in the trenches, meeting them under a great variety of circumstances, all working heart and soul for the same purpose, convalescing with them in hospitals and chumming with them during periods of leave; this intimacy is something that brings them closer together than they will ever be brought by any other influence; and during these days our men are in a position to urge Canada's claim for immigration in a way that will lead in a great many cases to definite results when the war is over.

The reputation that Canadians are making as ultra-loyal subjects of Great Britain is stirring a chord in the breasts of Englishmen and of our Allies which will be quickly responsive to the suggestion of settling in Canada after the war. We recall, some months ago, reading of an Australian who happened to have enlisted, while in England, with an English regiment. He was in the neighborhood of one of the great engagements in which Canadians covered themselves with glory by their resourcefulness and their fearlessness. Their energy in repelling attack and in carrying forward an attack against seemingly impossible odds, so worked upon this Australian's imagination that he exclaimed, "Canada for me after the war is over; the country that can produce such men as these is the country for me." That is how the idea will work out in thousands of cases if we see to it that the Canadians now at the Front and in England are furnished with sufficient definite information about Canada to talk invitingly to those whom they meet.

One may think, at first, that it is not necessary to go to any expense to put information in the hands of our soldiers for such a purpose, as, being Canadians, and knowing Canada well, they will naturally know how to attract others toward Canada. But this is not so. Few of us, if put to the task, could deliver even a five minutes' talk about Canada's attractions for the intending immigrant. Yet if we were furnished with the small amount of information necessary regarding the really important points we could draw a picture that would appeal to anyone who had the future before him.

Therefore, we hope that this idea of sending to the Canadians abroad a reasonable amount of well prepared literature to fit them for this work, will appeal to those who have charge of immigration matters at Ottawa.

Can Northern Ontario Bush Fires Be Prevented ?

The frightful loss of life and property from forest fires in Northern Ontario need not be accepted by the people of the province as wholly due to unavoidable causes.

Evidence thus far received indicates that the huge conflagration had its beginning in "slash" fires started by settlers for the purpose of clearing their lands.

For many years the menace of settlers' fires during excessively hot spells has been increasing, largely for the reason that no machinery of any sort existed whereby a settler's so-called "liberty" of destroying lives and property could be curtailed. On the other hand, the damage by railways has been rapidly lessening, as patrol and equipment have been improved, so that in 1915 the Canadian Pacific, Grand Trunk, Canadian Northern, and Algoma Central were credited by the Ontario Government with 110 fires in the railway zone, causing a property damage of only $4,156. On the Transcontinental and T. and N. O. (Ontario Government 1915 report) 317 fires were reported in 1915, the amount of damage being unstated. Investigation shows that both in Ontario and Quebec the settler and not the railways primarily must shoulder a very large part of the responsibility for annual forest fires, with a considerable contribution also from campers, fishermen, prospectors, etc. How is the settler to be brought under reasonable restraint so that the "slash" fire shall be eliminated forever from the causes of these North Ontario catastrophes?

In Other Provinces.

The laws of Quebec, British Columbia, and Nova Scotia place heavy penalties of fine or imprisonment upon any settler who starts a fire during the season of danger—April to November 15—without a written permit from a qualified forest ranger. The object of these laws is to make sure that the settler does not select a windy or abnormally dry day on which to carry on his fire operations; also that he piles his brush in the centre of his clearing, where the risk of contact with neighboring timber is at a minimum. This places no unreasonable hardship on the settler and, on the other hand, is a necessary guarantee for the safety of lives and immensely valuable timber in his neighborhood. During periods of excessive and dangerous drought the British Columbia and Quebec forest authorities have power to place a strict prohibition upon the setting out of all fires in forest areas for whatever period of time may be considered necessary.

What is the situation in Ontario? There is neither law nor regulation to prevent a settler letting loose conflagrations in any way and at any time he may select. No ranger has authority to advise or interfere with a settler in the employment of fire.

Under a watchful and modern forest administration the whole period of abnormal drought would have found every settler under a prohibition to set out fires of any sort. There was no such prohibition. Settlers' fires were started at the height of the danger season. Hundreds of lives, entire towns, and incalculable amount of growing crops and timber growth have been swept away and the whole Claybelt seriously set back in its development.

The control of settlers' clearing operations is but one foundation stone in the modern forest protective service, but had that been inaugurated by the Ontario Department of Lands and Forests the damage of the recent bush fires would probably never have reached its appalling proportions.

Before Fires Start.

A forest protection service is not supposed to be able to fight and overcome forest conflagrations once they have started to swirl across townships with the speed of a tornado. **The real business of forest rangers, and the governments responsible for them, is to stop fires from starting. Ontario, particularly in the Northern claybelt section, now so severely devastated, has practically no real ranger patrol, carries on no preventive campaign, and offers no opposition to the wholesale use of fire by settlers for stripping their soil of tree growth.**

In the spring of this year the Canadian Forestry Association, through their secretary, met the Associated Boards of Trade of the Temiskaming District at a meeting in Haileybury and asked that joint action be taken to stop the extravagant and dangerous burning of the northern forest areas by settlers. Some of the members of the Associated Boards frankly opposed any interference, asserting that many of the settlers favored free-running fires, and would not support such a measure as was proposed. Other members of the board took a more favorable point of view, but no joint action was taken.

From February to June, 1916, through the representations of the Canadian Forestry Association, twenty-two of the leading Boards of Trade of Ontario asked the Ontario Government to bring in legislation to control settlers' fires and also to reorganize the entire forest protection service of the province. The reply of the Minister of Lands and Forests to these communications was to the effect that the matter would be considered.

The Ontario forest protection service stands urgently in need of three main reforms, which, year after year, have been urged upon the governments by the Canadian Forestry Association, the Commission of Conservation, and other bodies:

1. Remodelling of the ranger service so as to give real protection to the forest wealth of the province and supply a fair return in service rendered for the money spent thereon. **The Ontario system is recognized generally as out of date and inefficient.**

2. The employment of inspectors in the ratio of at least one inspector to ten rangers, so as to get the maximum degree of actual forest protection. Over an area of ten million acres of timber lands under license, Ontario has just eight supervisors, each being required to manage, on an average, 36 men, a task so impossible that often not more than one flitting visit to the ranger on duty can be paid in an entire season. An industrial workshop would show bankrupt results under such loose inspection of workmen, and the forest patrol suffers in no less degree.

3. Sufficient rangers must be provided to patrol the Claybelt region, most of which is now under tree growth, and these rangers must have authority to control the burning operations of settlers so that holocausts, such as that of recent date, shall have less opportunity to recur.—Canadian Forestry Association Bulletin.

A Great Future for the Lumber Trade

An outline of what the lumber industry may expect in the way of foreign trade when the European war ends is given by Ernest W. Tickle, of Liverpool, in a letter to his brothers in the United States lumber trade. Here is the way he expresses the conditions in the industry as they will be abroad: "There's a good—and overwhelmingly good—time coming for the lumbermen of your country and ours when once this cataclysm is behind us, perchance before the actual end of the bloodshed arrives; because if once the German army has to evacuate the present scene of warfare in Northern France and Belgium, then the first duties of the respective governments of these mangled territories will be to rehabilitate as quickly as possible the shattered industries which formerly headquartered there for, as you know, these were the heart-centres of the commerce and industries of our allies. Think of the hundreds of factories and workshops and the myriads of homes to be rebuilt, and then try and estimate the lumber bill that will be wanted for immediately deilvery when once the job is taken in hand!"

A notable business feature arising out of the war has been the revival of the hemlock bark industry in New Brunswick. The scarcity of tanning acids has led the leather tanners to return to the old bark tanning process, and, as a result, large shipments of the bark are being made from the province. Bark peelers get about $8 per cord for the product.

Immigration After the War—A Practical Suggestion

Editor Canada Lumberman: Meaford, Ont.

Would not the present be a most opportune time for our Government or any duly appointed organization, to make good use of every Canadian at present in the overseas service?

The fact that they are serving is good evidence that they have the welfare of their country at heart. If supplied with a little good literature—say, once a month—every Canadian soldier could be made a most effective advertising agent for Canada. Our Canadians in England and France are constantly mixing with hundreds of thousands of men who will be looking for opportunities for bettering their positions when the war is over.

They could not be burdened with a large amount of literature for distribution, but could be supplied, say, once a month, with just a little fresh data, which they could use, or perhaps distribute, and if a supply were to come on monthly, it would mean effectual advertising.

In thousands of cases a very warm friendship will develop between Canadians and their English and French allies, with whom they are constantly associating, and now is the time to have all eyes turned towards Canada. There is no country in the world furnishing better opportunities for returned soldiers than our Canadian West. It is already well supplied with railways, and thousands of miles of rural mail and rural telephone service are being installed every year.

Canada's three great transcontinental railways offer unlimited possibilities to the right type of men looking for opportunities to make good.

Is it not up to those who are remaining at home to be alive to the situation, and do all in their power to promote our country's welfare?

The Seaman, Kent Company, Ltd.,
F. Kent, President.

B.C. Production Much Handicapped

Labor and Car Shortage and Weather Conditions Reducing Output—E. P. Sharpe Returns from Coast

Mr. E. P. Sharpe, of Muir, Kirkpatrick & Sharpe, wholesale lumber dealers, Traders Bank Building, Toronto, recently returned from a month's business visit to the Pacific Coast. In conversation with the Canada Lumberman, Mr. Sharpe laid special emphasis upon the fact that it was becoming more and more important for the Ontario trade to anticipate, so far as possible, its requirements in British Columbia stock. Heretofore the Ontario trade has been receiving prompt shipments in British Columbia goods in many instances, but conditions have changed materially within the last two months. The reasons for the conditions existing to-day are as follows: The white labor has, in many cases, resigned and gone to the prairies to assist in the harvesting, and many have joined the army. Oriental labor has made large demands upon employers for increased wages, and at the present time employers are not able to secure sufficient help. Many mills desire to run 24 hours a day, but this cannot be done without a portion of a white crew, such as sawyers, etc. Therefore, shipments have been greatly delayed, as the production is not equal to the demand. The chief demand for British Columbia materials is coming from the Prairie Provinces and from the United States markets. In future, Mr. Sharpe believes, that the Ontario trade will be acting wisely if they order British Columbia materials considerably in advance.

British Columbia mills to-day have more business than they can comfortably handle. The mills that are producing British Columbia pine have been handicapped to such an extent by conditions such as above mentioned and by natural conditions, such as great spring floods, car shortage, scarcity of labor, etc., that they feel that it will be from four to five months before they will be in shape to make reasonable shipments. They have all been putting forth every endeavor to meet the increased demand for materials, and have fallen short in production. These conditions apparently exist throughout the whole province, and all the mill owners have been voicing their views along the same lines.

There is a shortage of shingles upon the Pacific Coast; also a shortage of fir uppers, such as ceiling, flooring, etc. The mills that had accumulated large stocks of these classes of material in the past two years have absolutely depleted their stocks, and it takes considerable time to produce this class of stock, as the mills do not endeavor to cut for 1 x 3" or 1 x 4" stocks, except in edge grain stock. All narrow angle green stock is derived from the edgings. There is no doubt that prices will hold firm in the lumber and shingle market and will hold firm for some time, Mr. Sharpe says.

The trade will no doubt be interested to learn that some of the mills in British Columbia are interested in shipbuilding propositions, and they figure that in the near future they will be able to operate some of these vessels for the purpose of transporting their stocks to the Eastern markets, so as to receive a better mill price than they have been getting in the past, as current prices do not give them the profit which they desire when they have to pay 67c a hundred pounds on stock to ship it by rail.

The prairie markets are paying a greater price for many items on the list than the Ontario trade will pay, and the demand is very brisk from all parts of the prairies for British Columbia materials. The prairie buyers are numerous in the interior of British Columbia and also at the coast, endeavoring to get enough stock to fill their orders with reasonable delivery.

Mr. Sharpe visited Victoria, Vancouver, and a number of points in Idaho and many of the important mountain mills in British Columbia. During his trip across the prairies he learned that the crop situation generally is considered satisfactory, even good. He heard occasional mention of black rust among some of the crops in Manitoba, but persons who are well posted on the crop situation advised him that there will be more than an average crop this year. He was informed that the majority of the wheat has now practically passed the danger period, and that no damage from weather conditions is anticipated.

The logging situation in British Columbia he reported to have eased off to a considerable extent. Plenty of logs are now available, but there is no over-production, and prices are holding firm.

Canadian Sawmills Interest Englishmen

It is expected that the two forestry battalions now being raised in Canada the 238th and 246th, will provide all the lumbermen that will be needed for the operations in the Old Country, in addition to the 1,550 men already there—members of the 224th Battalion. The three battalions will have a total strength of over 3,600 men.

The 238th Battalion, under Lieut.-Col. Smythe, is well over the 700 mark, while the 246th is just being organized. The commander of the 246th,Lieut.-Col. John B. White, is in Ottawa buying equipment for both forestry battalions. He has already been overseas looking over the timber ilmits, and knows the needs of the new units.

The 224th is doing most of its work in the North of Scotland, cutting Scotch pine. There is a company at work in the park at Windsor Castle, cutting trees there, and a third company at New Forest. There is also a party in a camp near Dover and some men are still at Bramshott.

The new battalions will probably be sent to France. Lieut.-Col. White was over the ground there and found a great deal of timber suitable for lumbering, so that it is likely, if not all, at least the majority, of the men now joining will soon be laying low the trees in France.

Eight sawmills have been sent from Canada to England, six for the 224th Forestry Battalion and two for the Forestry Committee in England, which has supervision over the lumbering operations there during the war. They are mills typical of the Casadian lumbering industry and are generally known in Canada as portable mills. although they cannot be transported with the facility of most mills which carry the name "portable." They are entirely new to the British Isles, and their wonderful efficiency is said to be causing much interest. They each have a capacity of from 15,000 to 20,000 feet a day, and include the edger, slash saw, saws for making railway ties, etc., in addition to their big 56-inch circular saw. They have 40 horsepower locomotive boilers.

Liens Were Nullified—An Important Judgment

The case of the Sterling Lumber Company v. Jones, in which a judgment was given some months ago by an official referee, Mr. R. S. Neville, K.C., was subsequently taken before the Appellate Division of the Supreme Court of Ontario and the the judgment of the official referee was affirmed. The case was an interesting one, involving the Mechanics" Lien Act. The Sterling Lumber Company and others had furnished material for a building under construction which was being put up by the defendant Jones. One James Oliver agreed to purchase the building from Jones as soon as it should be completed. This was done, the deed was registered, and the money was paid about two weeks before the plaintiff's and other liens were recorded in respect of work done for and materials furnished to the building owner. These liens were all filed within thirty days immediately following the last delivery of materials.

Oliver, before purchasing the house, engaged a solicitor to enquire into the condition of the deed. He found that there were no liens registered, and he endeavored to see that all claims were paid. He took a statutory declaration from Jones to the effect that all work and material were paid for, and that there were no liens and no one was entitled to file a lien. When the conveyance of the property to Oliver was registered the solicitor believed that all claims had been paid upon which liens might be founded.

The official referee had found that Oliver was an innocent purchaser for value, having no knowledge or notice of any liens then existing, and that he took his conveyance and registered it, through his solicitor, in the full belief that there were no such liens, and that he was therefore entitled to hold the property freed of all liens, and his executors, the defendants in the action, must succeed.

The plaintiffs based their appeal upon several points, the chief one being that they were entitled to a lien upon the lands in question, on which the house was built, having fulfilled all requirements of the statute to entitle them thereto, in respect of materials furnished, and that the lien could not be destroyed by a sale or conveyance of the land; and that Oliver could not relieve himself from liability by accepting a declaration as to the absence of liens made by the defendant Jones.

In the judgment of the Court of Appeal the views of the official referee were upheld throughout.

News Print Exports Greatly Increased

Canada's pulp and paper exports for the first quarter of the current fiscal year surpassed all previous records. Newsprint exports for the first three months of the new Government year, April, May and June, reached a total value of $4,624,632. This is almost one million dollars above the value of the exports for the same period a year ago and more than double the total of three years ago. These exports were greater than for the entire twelve months of the fiscal year 1911-12, and double the volume of export for the year 1909-10.

The growth of the trade is illustrated in the following figures of the export of newsprint:

First quarter 1913-14	$2,281,413
First quarter 1914-15	3,073,565
First quarter 1915-16	3,657,132
First quarter 1916-17	4,624,632

Muir, Kirkpatrick and Sharpe have moved into more extensive quarters in the Traders Bank Building, Toronto, a step rendered necessary by the growth of their business.

Output of Forest Products in B. C.

Quantity and Price Both Reduced in 1914, as Compared with 1913—Shingle Output Greater

A report upon the output of forest products in British Columbia during 1913 and 1914 has been isued in a market bulletin by the Forest Branch of the Department of Lands. The statistics for the 1914 lumber cut are based upon reports from 216 sawmills and 49 shingle mills. In 1913 more plants reported production of lumber, lath, and shingles—namely, 230 sawmills and 52 shingle mills.

The gross production in 1913 and 1914 follows:

	Cut.		Total value.		Value per M.	
Product.	1913.	1914.	1913.	1914.	1913.	1914.
Lumber	1,227,496M	883,473M	$19,172,354	$11,749,257	$15 68	$13 30
Shingles	867,422M	982,935M	1,655,548	1,773,570	1 91	1 80
Lath	85,858M	45,069M	165,738	84,158	1 93	1 85

This comparative table shows a reduction in lumber and lath production in 1914, as compared with 1913, of 38.3 per cent. in lumber and 90.5 per cent. in the case of lath. This is attributed to decline in building operations during the whole of 1914 and to the shock to commerce incident to the outbreak of the European war in August of that year. On the other hand, the production of shingles increased 12.1 per cent. in the same period.

The table also shows the variation in price of all these products. In every case the price given is net average at mill.

Output of Lumber.

The following tables show the amount of lumber cut during 1914 and 1913, classified according to species:

STATEMENT SHOWING AMOUNT OF LUMBER CUT IN 1914, CLASSIFIED ACCORDING TO SPECIES.

Wood-Using Statistics.

Statistics are also given of the wood-using industries of British Columbia, showing that the total consumption was 85,827,464 feet B.M., the average price being $10.37 per M feet and the total value $890,007.64. The greater proportion of the stock consumed in the wood-using industries of British Columbia came from British Columbia, the amount being 84,636,964 feet B.M. From the United States these industries secured 933,000 feet; from the remainder of Canada they purchased 74,000 feet; from other countries, 183,500 feet.

In 1913 the United States supplied these industries with $202,000 worth of wood, and of this total $126,000 was for Douglas fir.

The relative importance of the different wood-using industries is shown by the amounts they consumed, which during 1914 were as follows: Pulpwood, 50,997,000 feet B.M.; boxes and crates, 23,617,964 feet B.M.; sash, doors, and interior fixtures, 5,054,000 feet B.M.; tanks and silos, 1,677,000 feet B.M.; ship and boat building, 1,486,000 feet B.M.; cars, 1,259,000 feet B.M.; cooperage, 1,186,000 feet B.M.; machine construction, 224,000 B.M.; caskets, 85,000 feet B.M.; patterns and flasks, 84,000 feet B.M.; vehicles and vehicle parts, 76,500 feet B.M.; cigar boxes, 60,000 feet B.M.; elevators, 21,000 feet B.M.

During 1914 the production of mine-props amounted to 23,102 cords, the average price being $4.71 per cord and the total value $108,698.59. The greatest production was in Western larch—9,448 cords—which was followed by Douglas fir, 6,091 cords; spruce, 5,547 cords; jackpine, 1,657 cords; Western hemlock, 300 cords, and Western red cedar, 59 cords.

The production of piles during 1914 amounted to 9,722,171 lineal feet, the average value being 6.5c per foot.

The production of poles during 1914 amounted to 4,339,234 lineal feet, the average value being 5.68c. per foot.

H. R. MacMillan Back from World Tour

H. R. MacMillan, chief forester for B. C., returned recently from an eighteen-months' tour of England, France, Holland, South and East Africa, Burmah, Australia and New Zealand, as special trade commissioner of the Dominion Department of Trade and Commerce, to inquire into export possibilities for lumber products of the Dominion. Before he considers his study of the question complete he will visit China and Japan, for which places he anticipates leaving in a short time.

His tour has left Mr. MacMillan convinced of the necessity of co-operation of the lumbermen of Canada, a keener study of market conditions, and the securing of ample cargo space. Inter-imperial trade would only be successful by operation along the best business lines, and this means that exporters must offer competitive prices and fill orders to specification both as to quality and quantity. In connection with the difficulties of exporting lumber which have been so much felt since the war, Mr. MacMillan endorsed the building of ships locally. Cargoes of British Columbia lumber would never go begging.

Nevertheless, said Mr. MacMillan, it would be something of a surprise and disappointment to people of British Columbia to learn that few of the importers abroad knew other than that the lumber was grown in the United States. Practically all the British Columbia raw materials were shipped through United States firms, who billed it as American lumber. San Francisco and other American ports on the Pacific coast had studied the export situation, had organized, and now controlled the charters in such a way that it was practically by their consent that British Columbia got the export opportunities she had.

Mr. MacMillan stated that the trade prospects were good. In many countries, Australia for instance, forests were thinning down rapidly and there was an increased demand for foreign lumber. Canada would continue to have competitors in some lines of raw material. Russia was practically unknown as an exporter, but Norway and Sweden would continue to be keen competitors in some lines of the business. There was a very ready disposition throughout the British countries to buy lumber within the empire and keep the trade at home. But even so, good business terms were expected, and the exporter must look to this if he wished to make and hold the market against the strong competitors already established.

B. C.'s Forest Reserves Exhibit at the C. N. E.

The forest resources of British Columbia have been represented for two years past at the Canadian National Exhibition, held in Toronto, by a display of the forest products of that province. Much interest was stimulated by the exhibit of last year, which was in charge of one of the Forest Branch officers, and which was awarded a gold medal. In view of the growing hold of British Columbia woods on the important market afforded by Eastern Canada, the exhibit to be placed on view this year will be on a more ambitious scale. Space has been secured in the Government Building, and in front of this space will be erected a handsome facade composed of pillars of Douglas fir in the rough, behind which the smaller exhibits will be arranged. The walls will bear panels of the different commercial woods of British Columbia, together with photographic enlargements showing forest stands, operations of the logging and sawmill industries, etc. The walls will be divided into six sections by means of pilasters of various woods, and to each of these will be attached, in such a manner that they can be readily swung, doors in various styles and finishes. Exhibits of articles made from Douglas fir, Western soft pine, Western hemlock, Western larch, Western red cedar, Western white pine, and Western spruce will be shown, with samples of flooring, veneer work, wood stave pipes, creosoted wood paving, railroad ties, piling, and bridge and trestle timber. Interior trimmings in the form of specimens of mouldings, casing, bases, etc., will be included, and, among other features, silo stock, oars and paddles, a fully equipped boat, boxes and fruit packages, and samples of spruce showing the qualities of that wood for aeroplane construction. The whole will be in charge of the British Columbia Lumber Commissioner in Eastern Canada whose headquarters are at the Excelsior Life Building, Toronto.

Shell Box Prices Allow No Profit

In Fact, They Involve Loss in Numerous Cases—Wholesaler Confirms Canada Lumberman Criticism

Montreal, Aug. 4; (Special to the Canada Lumberman):—"The article on "Shell Box Prices—Are They Adequate?" in the Aug. 1 issue of the Canada Lumberman, is on the right lines, and confirms our experience," was the comment of a Montreal lumberman with a considerable business in shell box lumber. "The low price at which contracts have been let throw a great burden on the wholesaler who is anxious to do business, but who is apprehensive that if he sells to box-making firms he will have difficulty in obtaining his money. This, of course, does not apply to all firms, but to many who have gone into the box-making game. After our recent experience we have decided to sell only to the large companies and to let the unimportant people alone.

"The method of giving out orders is, in our opinion, on a wrong basis, and we believe that the course of events has proved this to be so. Under the old shell committee an inspector visited the factory before giving out a contract, in order to note the manufacturing facilities. This practice has now been abandoned, with the result that contracts have been let to many firms with inadequate equipment and at prices which could not possibly pay. In fact, we are certain that some contracts have been let at below cost. Dozens of firms have tendered without careful figuring of the expenditure. That is the only conclusion that can be come to when one knows the cost of the lumber, hardware, etc. The outcome is disastrous for nearly all concerned. Contractors of this class have fallen down on their deliveries, and the Imperial Munitions Board have had to cancel the contracts and to place them elsewhere, at higher prices. This involves delay and other difficulties. The wholesale lumberman who had taken a chance finds that he has been left, and is, of course, a wiser but poorer man.

"Competition by tender is, generally speaking, a business-like way of purchasing boxes, but the Imperial Munitions Board, in giving out contracts to the lowest bidders have apparently lost sight of the fact that there are other considerations besides price to be taken into account. They should have investigated not only the facilities of the contracting firms, but also their financial stability. Instead, apparently, price was the main factor, contracts being offered on the basis of the lowest tender to many box-makers who had tendered at what seemed to be reasonable prices, but whose tenders were probably figured on inadequate data as to cost. Men who had little or no acquaintance with the woodworking industry jumped into the business, and the quotations at which they accepted the work were laid down as a basis for work offered to competitors.

"We contend that this was the wrong method. Every manufacturer is entitled to a living profit, and, as the prices varied so much, the Imperial Munitions Board should have, for a given box, taken the average quotation of, say, a dozen substantial makers and offered contracts on this footing. This, we think, would have proved economical in the end.

"The failure of the Munitions Board to place large orders at certain prices with box-makers who have finished previous orders, and who are anxious for further work, should be sufficient evidence to the board that they are not offering sufficient money. The manufacturers who declined these orders did so because there was no profit in them. The delays occurring through giving contracts to men at unremunerative prices should also be a warning as to the danger of trying to obtain something for nothing. Get good value by all means, but beware of trying to secure the uttermost cent from the firms tendering.

"Some manufacturers who put in low tenders quickly found out that they stood to make losses. With a view to getting out of the difficulty, efforts were made to substitute inferior stock, but this proved to be of little avail, as the specifications are very rigid and the inspection very keen in most instances. If the board attempts to beat down the makers to a level which is below cost, it is not surprising that men will try to get round the strict interpretation of the contracts."

United States Lumber Cut of 1915—By Principal Kinds

Washington, July 28.—The lumber cut of the United States during 1915 by principal kinds has just been compiled by the United States Forest Service. Southern yellow pine, with a total cut of 14,700,000,000 board feet, forms 30 per cent. of the total, and was more than three times the cut of Douglas fir, the second on the list. Oak, white pine, and hemlock are the only other kinds with a showing of over 2,000,000,000 feet.

The figures include both the actual reported cut from the mills making returns and the estimated probable actual cut. The total cut of all species is shown as 37,013,294,000 feet, as has been previously announced by the Forest Service. It is believed that, at the outside, the grand total 1915 lumber cut did not exceed 38,000,000,000 feet.

The actual reported cut of lath in 1915 was 2,745,134,000, and the estimated total cut 3,250,000,000. For shingles the reported cut was 8,459,378,000 and the estimated total cut 9,500,000,000.

1915 Lumber Cut By Species.

From the Canada Lumberman of Thirty-five Years Ago

The Nipissing District

Some time since, we referred to the development of the Nipissing district by the building of a propeller by A. P. Cockburn, Esq., M.P., to run on Lake Nipissing next season. The proposed steamer, the "Inter-Ocean," is expected to be ready to make a trial trip by the end of June next. The workmen to be engaged in constructing the steamer left Muskoka, by way of Rosseau, about the middle of last December. A correspondent, recently writing, says:—"Owing to the difficulties of communication all the settlers in the Nipissing district so far have settled on the south side of the lake; and there is actually only one man, with his wife and child, living in all the vast expanse of territory north of its waters. The establishment of short colonization roads running north and south from the lake; the navigation of the Sturgeon river and other tributaries of the Nipissing by the 'Inter-Ocean'; the daily arrival of trains at Callander, and the construction of the Sault Branch Railroad, will give a wonderful impetus to the settlement of the country. As demonstrating that the winters in the Nipissing District are not of necessity more severe than those in Muskoka, the fact is communicated that although last week there were about two feet of snow at Bracebridge there were only three inches at Lake Nipissing. The most recent surveys confirm every statement as to the fertility and suitableness of a large proportion of that country for settlement by agriculturists. A map carefully corrected by field notes, and issued within the past few weeks by the Crown Lands Department at Toronto, shows that in the townships south of the lake and French River 95 per cent. of the land is arable, and well wooded with birch, white oak, hemlock and balsam. It may be mentioned that the want of a steamer has been much felt by lumbermen in this district during the past year. It is not expected that the enterprise will be immediately successful from a pecuniary point of view, but there is such confidence in the future of that District that a Lake Nipissing Navigation Company will before long be formed."

Thomas Marcy, of Bigelow, Minn, is the new manager of the North Canada Lumber Company, Prince Albert, Sask.

German submarines during the last week of July sank four Norwegian vessels laden with lumber in the North Sea.

Keeping Track of Retail Transactions

A Systematic Arrangement Which Enables One Firm to Trace and Record All Kinds of Sales with the Least Possible Effort.

Some of the problems in connection with the routine work of a retail lumber office, that have to be handled frequently every day, lend themselves so definitely to systematic treatment that in many cases their solution has become almost standardized in all up-to-date offices. Once in a while one comes across a unique method of handling some of these problems by means of which the work is simplified and the results are improved. One or two seemingly small matters are dealt with in this article, but they are matters which, unless handled in some thoroughly systematic manner will cause a lot of difficulty. A short time ago the editor of the Canada Lumberman was fortunate enough to make the acquaintance of Mr. C. F. Middlebrook, formerly of C. D. Middlebrook & Son, Binghamton, N. Y., to whom he is indebted for the material upon which this article is based.

In the first place this company have adopted the use of an order blank which appeals to us as extremely simple and effective. It happens, in connection with all retail lumber yards, that a good many orders are received over the telephone. Before these order blanks were used telephone orders were jotted down upon such plain bits of white paper or scrap paper as happened to be handy. This led to confusion and uncertainty on account of the impossibility of filing

Telephone Order Blank Used for All Orders Received.

such orders systematically. A telephone order blank was worked out in the first place, and, after a few changes, it was found to be so satisfactory that it was adopted in connection with all orders received at the office.

An All-Purpose Order Form.

These order blanks are 7¼ inches wide by 6¾ inches high. They are padded on the right, in blocks of white and yellow sheets alternately. The white original sheets are perforated at the top with three holes, the outer ones being spaced for an arch file. The yellow duplicate sheet is pierced with only one hole in the centre at the top. Several of these pads are distributed around the office—at the telephones, shipper's desk, etc. When an order is taken the original is placed on an arch file at the shipper's desk, where the order number is put on it. The yellow sheet is hung on a hook, and is merely a loader's memorandum for use outside, no effort being made to preserve it. The use of this duplicate removes the necessity for consulting the original of the order, both in the office and outside, where the loaders are at work.

When an order has been filled the foreman makes out a dray ticket for it. He puts the date of filling only, on the order sheet, which remains on the file until the close of the day. In invoicing, the checker puts the number of the dray ticket on the order blank. After the checking has been done the order forms are filed alphabetically in a vertical file, and they are transferred to a permanent file about once in two years.

When the order forms are in the arch file the lower edge is free, and when they are in a vertical file the upper edge is free. For this reason it will be noticed from the illustration that the firm name and the order number are repeated at the bottom of the form. The order form also contains a two-line blank for address, blanks for the time wanted and time promised, and numbered description lines for the details of the order. All of these have been found of practical use.

Dray Tickets in Triplicate.

The dray tickets, which are made out by the foreman when an order has been filled, are 6½ inches wide by 8½ inches high, and come in rolls of 500 each, consecutively numbered at the factory. These are used in a machine which makes three copies at once, numbered 1, 2, and 3 in heavy black type. Our illustration shows No. 1. The others are largely similar, with a few differences, which will be explained. When an order is filled, the foreman makes out a dray ticket for each delivery, showing date, customer's name, place of delivery, when and by whom ordered, the lumber firm's order number, the teamster's name and time out, description of merchandise and loader's name. These items, of course, are identical on all three dray tickets. Ticket No. 1 bears at the foot a printed notice as follows: "Received in good order by ————. Customer please sign and return by teamster." Ticket No. 2 is the office record, for use in case No. 1 is lost or

Dray Ticket used in Triplicate for Receipt from Customer, Invoice Check for Customer, and Office Record.

destroyed. Ticket No. 3 bears a printed notice at the foot as follows: "Customer please keep to check invoice."

Teamsters and foremen have strict orders that no delivery must be made without a dray ticket. They learn very soon that it pays to follow this practice. On return to the office the teamster signs ticket No. 1 and enters upon it the time of his return. If he has been unable to find anyone to receipt for the load he writes upon the ticket "No one on job" and his initials.

Invoices for all orders are made out daily. The billing clerk first sees that all of the dray tickets for the day are together. Then he compares these with the orders and puts corresponding dray ticket numbers upon the orders. Prices and extensions are then written on the dray tickets and the invoices are made out from them. It will be seen that this system, simple though it is, involving only two sets of printed forms, is very complete, and easily handled.

We also show an illustration of a sales analysis sheet used by this firm. This sheet is 24 inches wide by 12 inches deep, with columns for the chief lines handled in the yard, such as hemlock, white pine, N. C. pine, yellow pine, spruce, fir, siding, shingles, etc.; 18 classifications in all, and an additional column for goods not otherwise specified (N. O. S.). All columns on this sheet show dollars and cents, and the principal items show quantities (feet or pieces). In distributing the day's work upon this analysis sheet the dray tickets are used. First of all, the charge sales are attended to, each item being entered in its proper column. For instance, the sale of 380 feet of hemlock at $11.40 would be entered under hemlock, with 380 under the column headed "feet" and 11.40 under the column headed "dollars." An order for 4,000 shingles worth $16 would similarly be entered under "shingles" by writing 4 in the column headed "M"" and 16.00 in the column headed "dollars." The columns are then footed and the totals are footed. This grand total must agree with the day's charge sales as shown in the sales journal. The cash sales are then treated in the same way, and the combined totals must agree with the day's charge and cash sales. After comparison with the journal record, the totals of each kind of merchandise are entered in a record book, with charge sales in black ink and cash sales in red ink. The pages of this record book are as illustrated in the sales sheet. The record book is large enough to hold a month's work to the double page, and at the close of the month, when all the footings are made, the record shows a set of totals, giving the sales in dollars and cents in each division, with quantities in the main items, charge and cash sales being shown separately by the different colored ink. There is one more division that it is interesting to note. Sales in connection with which deliveries are made direct from the car are indicated by drawing a red circle around the item and keeping it separate until the footing is made. The total of all car sales for the month is also shown in the sub-footing for the month, and a glance at the column footings show the items.

The monthly footings show how the sales are made up and enable the manager to look sharply after any line of stock that is moving more slowly than it should. They also form one side of a perpetual inventory, and are an aid to intelligent distribution of overhead, as the sales going through the yard are separated from the car deliveries.

The greatest practical value found in connection with this system is the fact that the firm knows the sum of its sales, as shown on the journal and the ledger to be the sum of all the items shown on the dray tickets. In making out a long invoice the billing clerk will sometimes strike an item that would require reference to a previous sale, estimate, or something of that kind, perhaps for several items. It is easier to write out the item, leaving price and extension to be put in later. Once in a while the bill may be footed without these entries, and the omission may not always be caught in checking. The sales analysis always catches these omissions. Once it caught the error of a misplaced decimal point, which is a very easy matter to overlook. "40M extra clear red cedar shingles at $5.50 per M, $22," got through, but in the analysis it was caught at once. This system paid for itself in a few months. In a business doing, say, $200 per day the daily work of analysis and entry in this manner and the monthly footings take up less than an hour a day of one person's time.

The Value of Cost Finding*

It is necessary to-day for a manufacturer's success that he knows on what articles he is making a profit and on what he is incurring a loss. A prominent vehicle manufacturer recently made the statement that he was forced, for his own protection, to install an efficient cost system. This showed, he said, that he had been in the past laboring under a wrong impression. He was surprised to find that where he thought he was making money he was not making it, and that certain lines he was not pushing were affording a far greater percentage of profit than lines he was actively pushing.

Unfortunately, the value and importance of proper cost accounts are often underestimated. So long as the details of a business can be carried in mind cost records are not so essential, but when this cannot be done it becomes absolutely necessary for the safe conduct of business that costs be kept. They serve three broad purposes—first, they show the cost of each product second, they permit the elimination of unprofitable business; and, third, they establish a correct basis upon which to make future prices.

Arbitrarily making a price may result not only in a direct loss, but an indirect loss by reason of the demoralizing influence in establishing a false price for future business. A manufacturer owes it to his stockholders, his employes, his customers, and his competitors to accurately determine his cost of production. To sell blindly a product of which the complete cost is not known almost invariably produces bad results, not only to the company but to the industry as a whole. Your most dangerous competitor is the man who does not know what his goods cost him.

Index to Efficiency.

Another marked advantage of properly kept costs is their value as an index of operating efficiency. With properly prepared cost figures the relative efficiency of the various departments of plants may be watched and compared. The current results obtained in each department may be checked against those obtained in the past, thereby showing increases in efficiency, or the reverse, and the results of improvements in practice. The judicious use of accurately prepared costs will help to bring to light poor and inefficient management, and will enable standards to be set for the less efficient departments, based on what actually has been done in departments that are being properly and efficiently administered.

It is a fact too little realized that scientific cost keeping is fundamentally related to manufacturing efficiency. A cost system in the hands of an executive who thoroughly appreciates its possibilities is a most effective instrument of control. A majority of our business failures can be attributed to poor accounting and inadequate business information. Bad office methods, inadequate and unreliable costs of production and distribution cause a great deal of unfair competition and a heavy business death rate.

I know I am safe in saying that with better accounting many of our bad business practices would be brought to light and promptly

curbed. When accurate results are known to proprietors and to creditors, conditions never become so bad and losses never so great, as good accounting gives reliable information and timely warning.

There is no net profit until everything in the way of expense and service is taken care of, including depreciation, taxes, insurance in all its forms, losses from bad debts, price discounts, expense in collecting outstanding receivables, etc. The omission of such items as these is the reason that the final profit and loss account at the end of the year is so often disappointing, and so difficult to reconcile with the profit percentage that was added to the supposed cost of the goods.

The Attitude of Banks.

There is another phase of this subject which manufacturers should not lose sight of, and that is the attitude of banks in the matter of getting credit. Banks are paying more and more attention to the accounting methods used by the manufacturer to whom they extend credit. They are willing to give larger loans and very often more liberal terms to the business man who keeps his books in a way that enables him to show the bank at any time the true condition of his business. A business man who can give a bank this information will receive more consideration with the same amount of assets than the one who cannot.

If merchants and manufacturers would agree on some standard practical system of accounting it would go a long way towards eliminating the unintelligent and destructive competition that is so manifest in many of our industries of to-day.

It is of great importance to the manufacturers of an industry that they agree on the elements or fundamentals of a cost practice, especially to make sure that all of the elements of cost are included in their calculations. This is of vital importance. Make sure that you have included in your cost an adequate provision for depreciation and every expense of every description incurred during the year. The test of the accuracy of a cost system is that it dovetails in and co-ordinates with the financial books of account. The costs then, in the aggregate at least, must be correct.

Betterment of Trade Conditions.

Production costs, determined by a uniform practice, have been demonstrated to improve trade conditions to a remarkable degree. Excellent results are being attained by trade associations appointing a man to devote his entire time to visiting the concerns that are engaged in their industry, getting acquainted, preaching the gospel of good accounting practice, reconciling differences, and in standardizing methods. When the person engaged for this work has the subject at heart, is congenial and persuasive and well grounded in the principles of cost accounting, the results in improving the general welfare of the industry are surprising. There should be no selfish motives back of such service. There should be the same willingness and free spirit to help and to aid and bring in line the non-member of an organization as there is manifested in the member. The non-member is usually the trouble-maker. In the interest of the industry he should be guided by the experience of others. The fallacies and disastrous results of bad business practice should be pointed out to him.

Business men are looking upon activities for the general welfare of their industry in a new light. They are being governed by the single purpose to promote the best interests of the community and of the industry in which they are engaged. They are putting aside sectional differences, and there is the broadest and most generous co-operation for the general good.

The lack of a correct knowledge of one's business carries with it various undesirable results. In the first place, the manufacturer is unable to conduct his business upon sound business principles. The result is reprehensible practices as disastrous at times as intentional unfair methods of competition. In the second place, he severely handicaps himself, in that he is unable, when seeking credit, to produce a correct statement of his financial condition which would enable a banker to extend to him the full credit to which he is entitled. He thereby hampers and limits the possible expansion of his business.

Nearly every business man is perfectly willing to include in his costs all items for which he pays out actual money, but he is inclined to overlook those which do not require a visible outlay, and depreciation is one of these. A number of manufacturers do not charge any depreciation, and give as a reason that they keep their plant in first-class condition and it does not depreciate. This is one of the most fallacious ideas in business to-day. Every machine, building, and apparatus, like every man, has a certain period of life, and no matter how much care you take of the machine or how much medicine you give the man, death is bound to come.

Many manufacturers hesitate to charge off depreciation because of the mistaken idea that by so doing they are really spending money. Nothing could be farther from the truth. You have not lost one penny by making an adequate charge for depreciation; on the contrary, you have strengthened your business and you are playing fair with yourself and with your competitors.

A Solution of the Waste Problem

By James E. Dewey*

The problem of waste, without doubt, is the most vital question that confronts every manufacturing institution in existence to-day, not only in the consumption of lumber alone, but it applies to any raw material that enters into the process of manufacturing your products. When you consider that statistics show all of the principal materials have increased in value from 25 to 150 per cent., which, I presume, is a conservative maximum, then you appreciate, to some extent at least, the great necessity for conserving the waste in these materials. Modern machinery and improved methods absorb a reasonable percentage of this increase in cost of materials by reducing the handling and manufacturing costs and otherwise creating a saving in production. We must then give our attention to other means of waste reduction, and I now refer particularly to your lumber requirements.

A great deal of abuse and criticism has ben heaped upon the heads of the lumber industry over the question of establishing a set of inspection rules which will conform more closely to the requirements of lumber consumers. While it is probable that the present rules can be improved upon in this respect, until this past year no united effort has been made by the consumers to encourage an interchange of ideas on the subject.

The elimination of waste is a factor which appeals to me more each day as I study manufacturing problems, and it offers unlimited possibilities toward the solution of our difficulties. This, again, suggests the importance of closer co-operation between the consumers and manufacturers of lumber. Those among you who are not familiar with the operation of a sawmill cannot appreciate the remarkable improvement in manufacturing methods of an up-to-date plant. To some extent this has been due to a natural evolution and the necessity of reducing costs, but the idea of conservation has been paramount in the development of these methods. Why, then, should not the consumer derive a benefit from these developments through a closer communication with the manufacturer? It is a surprising fact that a large number of lumber consuming industries of the present day make no attempt to compute their waste or estimate their cost of production. The important feature with them is the total production of their finished product within a specified time. Quantities of stock are burned which could be utilized in the production of useful articles at a profit. I consider this actually a crime, and some means of punishment should be meted out by our Government for such gross and needless waste of this country's resources.

We have come in contact with one case through our service department which will serve to illustrate this condition. This company uses a large amount of lumber each year, and one of our salesmen who calls on them regularly explained the idea of our service plan. The buyer was mildly interested, and agreed to consult our special representative, so that an interview was arranged. Our representative has now held three meetings with that buyer, but so far has been unable to interest him. On the first visit the buyer resented his suggestions, and seemed to consider them a reflection on his ability. The succeeding visits were a little more productive, but so far the privilege of investigating their manufacturing operations has been refused. We know positively that we can offer suggestions which will save money, not only in the purchase of material, but also the waste in their production. This instance is only one of many, and emphasizes my former remarks regarding the closer co-operation between the purchasing and operating departments.

The principal factor in the waste elimination is in the selection of your raw material, and this again reverts to the purchase of your requirements. In this connection we must first consider the kind of material best adapted. It is necessary to know what physical properties in the wood are most essential for the use intended. This is in regard to strength, texture, grain, weight, etc. Next, the choice of grade or grades which will produce the maximum of product with the minimum of waste at the least cost, and then the selection of widths, lengths, and thickness most economical for the sizes of your cuttings. In this connection, where narrow widths or short lengths are desirable, it immediately reduces the initial cost of your material.

Now we come to the products of timber waste which may be utilized to advantage. This at once offers opportunities for conservation that are unlimited. Cossidering these facts, who is better qualified to offer constructive ideas and furnish specific information in the proper understanding of these factors than the lumber manufacturer whose knowledge from years of study and experience enables him to proffer most valuable knowledge? It is a deplorable fact that we have never been given the proper consideration in this respect, while in practically every other line of materials you immediately call in the producer to confer on your problems.

Our mutual interests have millions of dollars invested that are dependent on the great timber resources of this country, so I implore your earnest co-operation and assistance to curtail this wholesale slaughter of nature's bounty for the sake of our own existence and the benefit of posterity.

Stock List Evils—Real Salesmanship

Advice from a Yellow Pine Salesman That White Pine Men May Absorb to Advantage—Practical Selling Suggestions.

By Robert H. Brooks*

SIX years ago, and for some years preceding that time, it was my lot to be a part of a retail lumber concern located in one of the larger Middle West cities. This town was, and still is, the home of several large manufacturing companies, and consequently our yard was on the calling list of a number of home office representatives. Being a market in which large quantities of pine were absorbed, it may be presumed that these salesmen were among the best on the payrolls of their various companies. These men were all amiable and courteous fellows, with whom we became well acquainted and whom we grew to like. Liking them and being human, we gave them our patronage, placing orders for various items with such mills as we knew from experience were most likely to ship what we wanted. I may say, however, that, with the exception of our transactions with the representative of one concern from which we secured the greater part of our requirements, almost every carload shipped into our yard was bought by us and not sold by the representative.

A former sales manager of the National Cash Register Company once said that cash registers were not bought, but sold. Unfortunately, the reverse mainly applies to lumber, for it is not sold, but bought. We have called lumber salesmen order-takers until that term has lost its force, but its meaning still applies to a vast number of these men. It appears, however, that one of the prominent factors which is contributing to this state of affairs is that famous adjunct to every lumber salesman's equipment—the stock list. Instead of using it merely as a memorandum to govern his orders in proportion to his stock, the average man employs it somewhat as a bill-poster, which, to all intents and purposes, might better be gotten up in big red and blue lithographed dodgers and read about like this:

> "750,000 feet No. 2 Common Strips — 750,000 feet — Count them! What will you give us per thousand? We are asking $14.75—but what will you give?"

What better inducement to offer $1.50 less could the buyer ask? Even asssuming that the salesman had instructions to disregard the market by so presenting it, he invites a Dutch auction and nothing else.

Not Enough Inspiration.

I think a great many of the shortcomings of lumber salesmen as a whole lie in a too long fafmiliarity with what they regard as a prosaic and bulky article which they no longer appreciate if they ever appreciated it at all. To sell an automobile involves the actual seeing of and close contact with the car itself. It is handled, ridden in, and admired by the buyer and salesman during the time of the transaction. The lumber buyer, on the other hand, sees nothing in a material way except the salesman. The commodity may be a thousand miles away, down at the mill. Consequently, the ordinary lumber sale merely involves a discussion of the grade, the price—usually as compared to a lower one said to have been offered—and the time of shipment, but some of you are saying the average dealer, contractor, or railroad buyer doesn't care a rap about anything except the price, and the price gets the order or loses it. One answer to that statement is that it takes a tree about 150 years to grow and mature. You cannot, therefore, adequately describe its various uses and worth with the mere words "$23.75 per M delivered."

It makes little difference whether the sale includes mill timbers for factory construction, car material, or interior trim. The salesman should be able to tell his man every possible detail about the physical make-up, proper handling, exact quality, and anticipated service involved in his product.

How the Real Estate Agent Works.

Consider for a moment the optimistic real estate agent. His lots are always well located, his houses modern, his decorations artistic, his new allotment in the best part of the city, and as to the cost—why, merely so many dollars. You can't afford to miss it. There is a good deal of "bunc" in real estate selling, true, but there is a lesson in it in creating desire. If the agent hung his argument on "50 x 125 feet at $900.00," he would soon starve to death.

Every paper written on salesmanship emphasizes creating the necessary desire for an article before the sale is possible. Granting the buyer must have lumber, we have a mere disinterested desire to begin with, and it will therefore take more than a stock list and prices to develop a genuine desire for your stuff above that of the other concerns.

Probably some of you are saying that this may be all right in theory, but not in practice. If so, what have you ever done to prove it? How, for example, would you approach an engineer or architect on a factory bill? Many salesmen have a reputation of going in backwards, with words about like this: "No. 1 long leaf yellow pine, 8 x 8", 10', 20" x 20"—40', at so much per M for the various sizes, shipment as per contract." That part off it, however, should be made incidental to the fact that geological conditions in the region in which your mill and timber are located are highly favorable to a dense growth, insuring a heavy percentage of summer wood and consequent great tensile strength, that timbers of this character are well within the new density rule on which contract specifications are based; that your stock will fully meet their requirements; and, in addition, that your concern brands its name on each stick, not only as an identification against substitution on the job or at the city yard, but as a trade mark as well, which is symbolic of reliable merchandise, behind which your firm stands with its reputation of twenty years. Drive these points into your prospect's mind and you will find him more interested in these physical qualities which he desires and which are essential to the successful carrying out of this contract than in the fact that to get your stock he must pay a little more money than for unidentifiefid stuff sold on a mere quotation.

An Example of Good Work.

One day a man dropped into a hardwood mill and asked the manager if he had any inch culls which he would like to dispose of. Almost anything would do, as it was for very ordinary use. This manager hadn't any on hand just then, but thought that a neighboring mill across the railroad track had a pile which was probably about what the buyer was looking for. "If you like," said the manager, "I will go over with you and see them." So the two men walked over and entered the yard at the lower end near the pile in question. "There is the stuff," said the manager, "and while you are looking it over I will walk up to the office and see what they will take for it." So the prospect looked the pile over and the manager walked along to the sales office. Entering, he said: "You have a pile of culls down there at the southwest corner of the yard. How much are you carrying it for on your books? Perhaps I can sell it for you." He was told, after reference to the books, that the stuff was listed at $250.00 on the records, and that he might have what he could get above that figure. The manager returned to the pile and found his man just finishing a rough tally.

Said he: "Well, can you use it "

"Yes, it is just about what I need."

"All right; make an offer."

"Well," said the buyer, "there will be a good deal of waste, but there is also a considerable amount of it, and I will give $1,000.00 for the pile as it is."

"Well, now, you will find that stuff runs pretty good," said the manager, "and we could not let it go at that figure, but will take $1,500.00."

The sale was made at $1,250.00, the buyer was satisfied, the company got its book value, plus $1,000.00, or 400 per cent., as the manager would not accept any division for himself. That is a true story, as well as a demonstration of what actually was done with an item which could scarcely be qualified even as a bargain. Of course, the buyer wanted the stock, but that manager made him desire it $250.00 worth more than he offered and 400 per cent. more than the owners expected to get out of it.

Now, take Southern pine stock. Five hundred mills, say, make the same kind of lumber, sell in the same territory, on the same grading rules. It is probably the idea with many salesmen in view of this situation—which is, indeed, a mistake—that with so much stock of identical character being offered on stock lists low prices are the only leverage available. However that may appear, it is more than apparent that such arguments—or shall we say impediments?—assuredly give no individual advantage over the other fellow. So, then, what will?

As an example, take finish. First of all, be sure that you sell the wood which actually is specifically adapted to use as finish, because some woods are not, and this fact will have to be recognized just as must the contrary one, that a wood adapted to finish is not usually a proper one for timbers. Assuming, then that your product is one suited to the use to which the buyer will put it, know and tell him, for instance, that your pine is from a district in which the species attains a state of perfection in timber growth—a fact recognized by forest service reports and other authoritative sources. If it is so, emphasize the fact that your wood contains a very low percentage of resin, combined with a lustrous texture and fine grain, which supplies the necessary absorbing qualities upon which a successfully finished interior trim depends. Also know and point out that your wood has certain individual advantages under various color treatments. In short, post

* Address delivered at Detroit World's Salesmanship Congress.

yourself on everything to be known about the use of your wood and you will find the buyer so interested in what the wood will do that cost will be secondary.

Possibly some of you are thinking that the average dealer knows the difference between long and short leaf yellow pine or white pine and hemlock, but beyond that you cannot teach an old dog new tricks. The answer is, "Try it." During a recent tour of inspection by some fifty Northern retailers through the mills of the South those men saw and learned new things about wood which they have been selling for the past twenty-fiears years, and which they never dreamed existed. Now, about one dealer in every 2500 ever sees a mill stock, so why not take the mill stock to the dealer in the form of a complete line of honestly-selected representative samples? If necessary, carry a trunk to hold them. Show everything, from a strip of waney edging from which lath are made up to a piece of 8309, with a mahogany and white enamel combination finish on it. The inspection of such samples themselves would get your customer's mind off that 50c per M less, which is worrying you so much, and will give you an excellent opportunity to pump him full of information about your plant, your timber, your dependable shipping department, and all the rest of it.

The preparation of such a salesman's equipment would develop new ideas for presenting the stock as the plan was carried on, until the salesmen themselves can, on their own initiative and creative ability pull themselves out of the stock list—low price—rut and on to the higher plane of real salesmanship. Did you ever watch a $10,000.00 a year shoe salesman in action? If not, make a point of doing so at the first opportunity. True, he has to show a range of styles, but to compare with that you have everything from "A" edge grain flooring to Byrkit lath. That salesman will take a $10.00 shoe and have it cut into two cross sections, to show the stuff inside and the make-up. He knows every step in the process of that shoe's manufacture and all about the physical qualities of every piece of material in it. Then, too, there are the cheap shoes for the cheap trade, just as there are cheap grades of lumber for the yards that cater to cheap contractors. He makes an analysis of the goods, which is the successful salesman's greatest lever. It is what the shoe, clothing, automobile or lumber will do, how it will serve, first, then come the terms of price, but not until the prospect's mind has been made to grasp the full worth of the article, and right there you have it, Mr. Lumber Salesman. In other words, sell yourself on your own product, after which it will be far more simple to talk convincingly to your customer.

Selling Methods Always Changing.

Lumber-selling methods are changing from year to year just as are other methods changing from year to year. They have, alas! been the last to show improvement, because stock list order-takers have been among the common garden variety of sales representatives for twenty years, and they are still with us in vast numbers, for the disease is almost hereditary. Happily, however, there are a few notable exceptions rising above the rank and file.

As to price-cutting, I recall in those retail yard days previously referred to a feeling of respect for the fellow who quoted his price on pine and stuck to it, on the basis of intrinsic value consistent with the current market price, and he was the one mentioned from whom we bought the bulk of our stock from common to finish. To be a confirmed skeptic is to keep yourself down to the ordinary level.

We realize that customs and habits of long standing are deep rooted and hard to change. Nor can a revolution in the old order be accomplished over night, but at least an attempt must and will be made. We all know it is the fellow with the ideas and the nerve to try them out who leads the procession. No one is satisfied with the stock list order taking method. Yet the majority of stock is sold on that basis to-day. Hence why cointinue it? The lumber selling field to-day offers magnificent opportunities for original thinking, new ideas, and distinguished accomplishment in salesmanship.

In conclusion, I would again emphasize that you talk uses and not prices, and, above all things, remember that it takes 150 years for a tree to grow and mature to the lumber-cutting stage, and that it therefore is utterly impossible to present adequately the worth and uses of that tree's product in the mere words "$23.75 per M delivered."

Attractive Yards Draw the Best Trade

Well Kept Stocks, Tidy Driveways, and Neat Fences Transform An Ugly Yard into One That Pulls the Customer Inside.

By An Alberta Yard Manager

"Orders be Orders," remarked Gordon Snow, the tall, slender local manager, to his yardman, who stood by anxiously watching the reading of a reply to a request for a new large up-to-date shed, which is so much the desire of all managers and their assistants.

It was plainly evident that the answer had been that times and general conditions did not warrant any expenditure for new or expensive plants and with the least expense possible the old one must be made serviceable, and there was no good reason why it could not be made so, and, furthermore, be the neatest and most attractive yard in its district.

Most men want large and expensive sheds, and then never have their lumber well or handily piled in them, having the short lengths, or unsaleable items, piled away in the highest part of the gable or attic or in some other inaccessible, out-of-the-way place so it is never easily got at, to be put on an outgoing load. It is, therefore, left there and never disturbed, and although occasionally spoken of, is always forgotten when loading up a customer. The wide, dry driveways always make a convenient and tempting place to dump loads instead of immediately piling the material in its proper place.

The instructions were so definite that all immediately set about putting the old yard in shape. Arrangements were made with the drayman and all steam plants for their cinders to be hauled into the driveway of the yard and the assistant would level them, crown the roads and make drainways for the water to run off. The dinky little hood was torn off the one-deck shed and doors made so as to keep the rain and sun from beating in, as the shed faced the south. This kept the finishing lumber and mouldings free from dust, stain, rain or sun, and as bright and clean as the day they arrived, and consequently were equal or even superior to any kept in a large enclosed shed.

The old fence was pulled into place and straightened up and given a coat of whitewash, it having been found that at a small expense, a fence could be whitewashed twice a year, so as to look always well.

The bearings in the yard were straightened up, and if they did not give enough slant or pitch, so as to run all the water off the piles, then an occasional inch piece, instead of a lath, was used in front of the pile only, as a cross piece. A few of these pieces soon raised the front of the pile so as to give the proper slant to run off the rain.

As to the office and sash shed, they were straightened up, all windows and doors properly marked and put into their places. The office was cleaned up, floors, desks and cupboards and all old calendars and other papers removed from the walls, and there were left thereon only those articles pertaining directly to the business.

To beautify the outside, vines, hops, Virginia creepers, scarlet

Climbing Foliage Gives an Inviting Aprearance to a Retail Yard.

Cleanliness and Neatness are Strong Factors in Attracting Trade.

runners, all of which grow well in this country, were planted, and soon the building was attractively covered with green leaves and pretty flowers, adding comfort and charm on warm days.

The accompanying illustrations show the result of the effort, and really, don't you think it was worth it? Does not the yard in general give to a customer an assurance of "Quality" and "Service" and that he will be satisfied, if he deals here?

What was done in Northern Alberta with so little outlay can be done at every retail lumber yard in the prairie provinces and all can have a yard as satisfactory and attractive if they will only put forth the effort.

A lumber yard like this bespeaks courtesy, and hospitality; it advertises itself and its being up-to-date. IT RESTS WITH YOU, Mr. Retail Lumberman as to the conditions of your Yard.

Evolution of White Spruce from Forest

Description of Processes of Manufacture of White Spruce as Found in Western Canada—Some of the Difficulties Encountered

By John P. Jacobson

The man who contemplates building a home for himself, whether on the prairie or in the city, gives but little thought of the operation involved which enables him to go to the nearest lumber yard and pick out just what material he requires for his building purposes. He buys his white spruce drop siding, flooring, ceiling, dimension and boards, and notices the smooth finish of the lumber, but he seldom stops to think of the hard work and the many difficulties that must be overcome before this spruce can be converted into what is displayed for sale at the lumber yard.

Vast stretches of land in Northern Manitoba and Saskatchewan are covered with as fine specimens of white spruce as anyone could wish to see. Last winter I had the opportunity of observing the logging operations of one of the largest mills in the Middle West, namely, the Finger Lumber Company,, Limited, the Pas, Man.

I shall endeavor to give you a brief description of their logging as I saw it.

The Finger Lumber Company's timber limits are located along the Carrot and Saskatchewan Rivers and at present the company is operating on the Carrot River and on the Sipanock Channel which connects the Carrot and Saskatchewan. The logging operations are planned a year ahead. The first man sent out is the cruiser and camp locator. This man locates the places most suitable for building the camps so that they will be within easy reach of as large a growth of timber as possible, as the aim is to have one camp last several years. The cruiser also locates the main log roads and the branch roads leading into the timber.

As early as July the company commences to ship supplies up the river, such as oats, provisions of all descriptions, and also a quantity of iron. In fact everything necessary for the operation of a modern logging camp is hauled up. The items required are numerous and it takes a man with a clear head to figure out the right quantities. These supplies are shipped by water in large barges towed by steamers and are unloaded at a central warehouse from which they are delivered to the camps as needed during the winter.

The first men are sent into the woods during August and September, and their task is building the camp. The camp is sometimes built of logs and sometimes of lumber from the mill. The camp consists of several buildings: the sleeping camp, the kitchen, the barns, blacksmith shop, warehouses, filing shack, office, etc., but the men are experienced and work with a will and the invigorating air gives them zeal and energy so that it takes but a short time to finish the construction of the camp. The next step is a very important one, namely, that of making the roads. As has already been stated, the roads were located by the company cruiser and the main logging road leads from a convenient place within the limit to be operated to the bank of the river. From this main road the branch roads lead conveniently to the timber and serve as feeders to the main road. A modern logger takes great care in making roads, especially the main roads. They must be graded and levelled and are provided with a rut wide enough for the sleigh runners. When the ground freezes, the road is iced, that is, a big water tank drawn by four to six horses and provided with sprinklers is continually hauled over the road; the water quickly freezes and a glaring ice road is the result. On this ice road it is an easy matter for two horses to draw loads containing from 12,000 to 15,000 feet and weighing something like fifty tons. During the winter the roads are kept constantly repaired by sprinkling water over them and this is done mostly during the night to avoid interfering with hauling the logs.

As soon as the roads are made the cutting of the timber commences. First comes the undercutter who marks with his axe the trees to be felled. The sawyers with six-foot cross-cut saws follow him and saw the trees down. The branches are cut off and the tree sawed into lengths of twelve feet and longer. The skidders follow the sawyers. The skidders' work consists of dragging the logs to the skidways along the branch roads. Horses are used for this work. As soon as the logs have been placed on the skidway they are loaded upon the logging sleighs and this loading is done with what is called a log jammer, a tripod-shaped structure with block and line. The logs are piled on the sleigh seven or eight tiers high, each tier being securely fastened with chain. As soon as the sleigh is loaded it starts

A typical load of white spruce loaded at the logging camp of the Finger Lumber Company on the Carrot River, Man.

Illustration No. 1.—Logging operations on the Carrot River. Logs released prior to being rolled on to the River.

Illustration No. 2.—Logging on the Carrot River. Logs on the frozen river waiting for the Spring floods to drive them to the mill.

for the landing where the logs are released and placed on roll ways which stretch across the river. This operation is seen in illustration No. 1. The logs which have been rolled on to the river may be seen in the second illustration.

In a brief way, this is what I observed on the trip to Finger Lumber Company's camps, but no description in this journal can convey to the reader the difficulties connected with the work. One must remember these camps are located as much as a hundred miles from a railroad station and it is, therefore, necessary during the logging season to maintain a line of communication with teams in such a way that the camps are at least within tri-weekly communication with the outside world.

It was a pleasure to note the fine camp buildings provided for the men. Each camp has about 125 men and with such a large number it is not easy to keep a good sanitary condition, but the daily visits of the camp doctor were sufficient stimulus to the men in charge of the camp to keep everything in the most perfect sanitary condition. It was interesting to watch the men come into camp at night. They had the elastic, springing walk of the experienced woodsman. They were a hearty looking lot of men and they certainly enjoyed the appetizing victuals provided by the chef of the camp and I assure your readers that the most exacting epicure would have relished the food with which the tables were loaded. There was vegetable soup, roast beef, potatoes, turnips, pies and cakes of every description, most delightful bread, and coffee and tea. After the meal the men spent their time in reading, smoking, mending their clothes, or telling yarns around the camp fire.

I have endeavored to give your readers some little idea of how White Saskatchewan Spruce is logged, but the logging is only one stage of the operations necessary to provide the farmer on the prairie with building material. When the logging operations are finished, the driving commences. Driving in the Carrot River is comparatively easy, as the banks are high and there are no lakes to cross. The logs float down with the spring flood and are placed in booms at the mouth of the Carrot River and thus ends the woods operations.

Next comes the towing of the logs to the mill and converting them into lumber.

Cost of Machinery

In connection with factory costs, there is a difficult problem for every manufacturer to work out, and that is the cost of machinery. What is meant by this is not the original cost of any given machine, but the proportional cost of the item of machinery for doing any given work. This must, necessarily, include the cost of machinery as compared to the work it does, the life of a machine or the amount of depreciation in value each year, and the chance, meantiime, of some other more up-to-date machine being invented, necessitating the replacing of the machine before it has really served its time.

It is considered that machinery depreciates about ten per cent. each year. This is, in substance, that the life of a machine should be reckoned at about ten years. This may be a fair average, but it is not conclusive. There are machines in use today that are seventy-five years old. Other machines are sometimes ruined through accident or something of the kind inside of five years. Some machines wear out very rapidly. Others last as long as a man. Estimates are complicated by the claims made for some new machinery that it will pay for itself in a very limited time.

The matter of machinery paying for itself raises a complicated question. It goes without saying that every machine must pay for itself in a certain length of time. Otherwise, it is a loss. But to make it pay for itself, a certain amount each year must be allowed to the machine for its share of the work, just as so much is allowed for the machinist. This is one way of looking at it. There is another way. There are those who say that improved machinery will do more work than others previously in use at the same labor cost. This is frequently true, but it, like lots of other truisms, depends to a certain extent, on other things.

In the first place, if it effects a saving over the old machine, you will have an advantage in first cost until your competitor puts in the new machine also. Then the situation changes. You haven't any more advantage over the other man in the business than you formerly had, and the benefits that accrue from the saving go to the world in general by cheapening the articles produced. This is one of the inevitable results of competition, and is a point which must be considered in deciding whether or not a machine will pay for itself on the basis of its work compared to the work of the older machines.

Another factor is the possibility of some other machine being invented soon after this new one is installed. This other machine may offer such advantages over the new one that it will become necessary to make a change before the machine has had time to pay for itself. In this case, if you don't buy the new machine, you are left behind by your competitor, who will get it and then have the advantage over you. It is easy to see, therefore, that this matter of the cost of machinery, and of machines paying for themselves, is a subject in which one may get tangled.—Hardwood Record.

Use of Lumber in Coal Mining

The consumption of wood in connection with coal mining operations is greater than many people realize. This is shown in an interesting manner in a letter published by the National Lumber Manufacturers' Association, from the editor of Coal Age. The letter says in part:—

"Every ton of coal mined in the United States requiries the expenditure of about 7 cents for pit lumber. Taking the coal production of the country at roughly 580 million tons, this means an annual expenditure for pit lumber of over $40,500,000. This includes what is ordinarily known as pit props, timber sets, brattices, overcasts, etc., or the lumber, mostly rough, which is used underground alone.

"Above ground neither I nor any other man knows or can estimate accurately how much is spent each year for building material in the shape of lumber. However, lumber enters into the construction either in whole or in part of practically all mine buildings such as tipples, breakers, hoist houses, sub-stations, offices, stores, magazines, fan houses, shops, warehouses, oil houses, power plants, boiler plants, pump houses, stables, etc.

"Furthermore, with approximately 750,000 men directly engaged in the coal industry, nine-tenths of whom live in company houses, the coal operators of the land must provide housing conditions for say 3,000,000 people. The majority of the houses are of frame construction although brick, hollow tile, and concrete and stucco, are being employed to a limited extent.

"You question whether the use of timber is on the increase or decrease in and about the mine. In answer I would say that as years go on, and the difficulties of mining due to greater depth increase, a greater amount of timber must be used. Not only this, but the price of this timber is constantly increasing, so that the amount spent for pit lumber from year to year increases more rapidly than does the output.

"As to the use of steel. This is being employed more and more for permanent timbering along gangways and headings. It is not, however, to the best of my knowledge and belief used to any extent in room timbering, and although the sale of steel mine timber is constantly increasing it is doubtful if at the present time more than one-half to one per cent. of the props used in mining are of steel."

Miscellaneous Items of Interest to Lumbermen

Canada's exports of forest products for twelve months ending June were valued as follows:—1916, $53,259,354; 1915, $43,228,935; 1914, $43,241,666.

The Department of Lands and Mines, Fredericton, N.B., reported under recent date that there were then no forest fires on Crown lands in New Brunswick.

New Zealand's imports of hewn and sawn timber during the first quarter of 1916 were valued at £47,328. During the corresponding quarter of 1915 the value of these imports was £97,879.

The Bell Telephone Company of Canada report that they have specified British Columbia fir for interior trim and finish in the buildings which they propose to erect this year in Barrie, Galt, Oshawa, and possibly in a proposed building for Levis, Que., with the idea of perhaps standardizing it for this class of work in place of quartered white oak, as they desire, if possible, to use domestic materials throughout their buildings.

The timber returns for June, issued by the Department of Lands of British Columbia show that the total scale of sawlogs for the province amounted to 120,023,869 feet board measure, in addition to 375,905 lineal feet of poles and piles, and 28,840 cords of ties, shingles, bolts, etc. Timber sales recorded during June cover an estimated total of 6,195,500 feet of sawlogs, 19,800 lineal feet of poles and piles, and 300 cords of bolts, etc., to produce an estimated revenue of $10,206.

The head of one of the largest lumber manufacturing firms in British Columbia reports that their volume of business during the first five months of this year was 300 per cent. greater than during the first five months of 1915. "Conditions are good, and from all signs they will continue to be so for some time. Most of the millmen I know," he continued, "have told me within the last day or two that they are stacked up with orders which will keep them busy for six months at least."

Editor Canada Lumberman:—

The article which you Published in the Canada Lumberman of August 1st about shell box contracts seems to us to have been written by a man who knows what he is talking about. We have not experienced any trouble in collecting our accounts from any of our shell box customers, but in our opinion there can be no doubt that some of the box makers are taking grave risks of loss in accepting contracts for shell boxes at the prices paid on recent orders.—Eastern Wholesaler.

New Horizontal Resaw With Interior Return Rolls

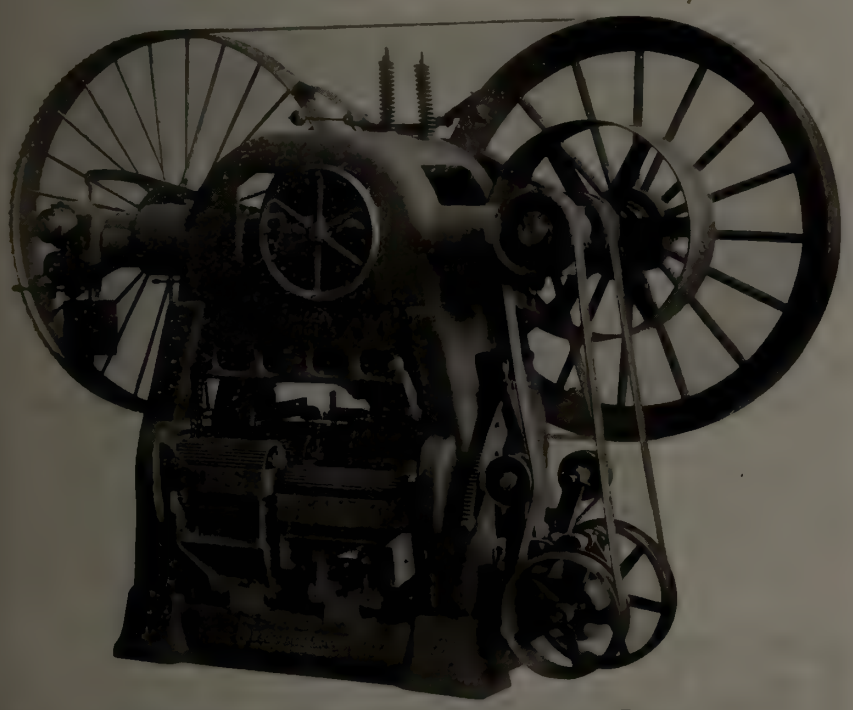
If one were to pay a visit to all the sawmills of over 50,000 feet daily capacity that have been erected during the past five years he could not fail to notice the prominent place given the sawmill resaw on the mill floor, or the important part it plays in the mill's operations.

The day is fast passing in mills of any size wherein the log is cut to the last board on the head rig, for mill men have been quick to realize the value of the heavy duty resaw as a manufacturer of lumber and have incorporated it in their operations.

The sawmill resaw, whether vertical or horizontal, has easily proven its worth as a lumber producer, and as such is running neck and neck with the head rig for the position of first importance in the mill. Of course, the head rig has the advantage of being the one indispensable machine in any mill, a position from which it will probably never be driven, but as the real lumber producer it is fast being distanced by the heavy duty resaw.

As is well known, sawmill resaws are divided into two well-defined classes, viz.: vertical and horizontal, the usefulness of each being dependent upon the log conditions. Thus, generally speaking, the vertical machine works out to the best advantage where the logs are of the best grade and where it is desirable to saw as much to grade as possible. In such operations the log will usually be cut to the best grades on the head rig, and the material in the form of deals of double thickness will be sent to the vertical resaw for centre sawing. This method relieves the head rig of one-half the cutting lines and, generally speaking, doubles the possible output of the mill.

Where the logs are small or of inferior quality the usual practice is to install a horizontal resaw, to which may be fed all material that may be dropped from the head rig—the only requirement of such material being one sawed surface. Thus a log of small diameter might be cut through its centre and the two halves passed to the horizontal resaw for completion; or, in case of a larger log, it could be heavy slabbed and the slabs cut into boards on the resaw, while the balance of the log could be cut to grade on the head rig and the deals sent to the horizontal machine for resawing.



Infeed End of Yates Type H 61 Horizontal Resaw.

Horizontal resaws operating on slabs and half logs require some provision for returning the uncut portion of the slab to the infeed end after each successive board is taken off.

In mills where sufficient floor space is available the uncut material is returned on a line of live rolls and transfer chains placed alongside the resaw. An installation of this kind encounters no serious obstacle in the mill wherein the resaw has received consideration in the mill plans, but the limited floor space of many existing mills offers no opportunity for returning stock in this manner. Many mill men who have recognized the advantages of the horizontal resaw have been deprived of its use owing to this lack of sufficient floor space.

The accompanying engravings illustrates a new addition to the Yates type H6 series of horizontal resaws, which has been introduced to facilitate the return of uncut material to the infeed operator by passing it back directly through the machine instead of returning it by the customary circuitous route around the mill on a long line of live rolls.

To accomplish this the machine which has been named the Type H61 is built with two sets of rolls, revolving in opposite directions. One set, the feeding rolls, is mounted in the standard Type H6 manner below the saw line in an adjustable frame that may be raised and lowered to secure the desired thickness of lumber. The other set—the returning rolls—is mounted above the saw line in a similar but stationary frame and driven at a slightly faster rate than the feeding rolls.

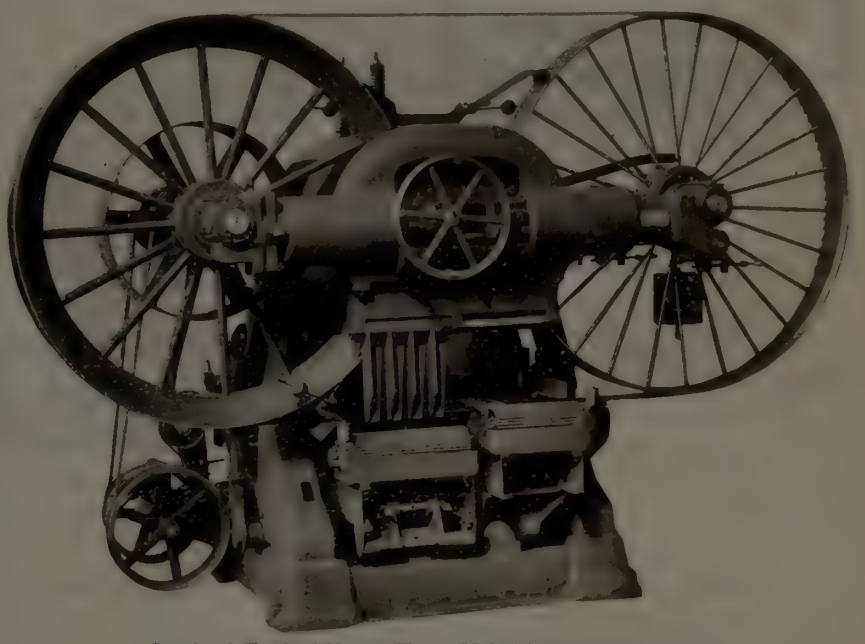
The advantage of a horizontal band resaw, as before mentioned, lies in its ability to manufacture material of the lower grades, i.e., small diameter logs and slabs, into lumber at a lower cost than it can be produced on the head rig.

The capaciy of such a machine is governed by the ability of the men and equipment to properly take care of the stock leaving it. In all ordinary operations such material is delivered to three outlets, viz.: the cut board is sent to the gang edger, the slab to the refuse slasher, and the remaining uncut portion is returned to the infeed operator to be passed through the machine for a second or third time.

In actual operation it has been very closely determined that a horizontal resaw carrying 6-foot wheels and a 10-inch blade is capable of receiving the average mill run stock at a rate of 250 feet per minute. This speed will permit handling only one piece at a time, but if the saw is kept continually in the cut a great capacity is obtained. To illustrate: If an uninterrupted average cut of 12-inch material is made, a well-built machine of this type will produce 15,000 feet of lumber per hour.

To assist materially the off-bearers this latest machine of the Type H6 Series is designed to return the uncut material in as convenient and direct a manner as possible. The uncut section is rolled from the top of the cut section on to the returning roll, where it is immediately returned to the operator's position at a slightly faster rate of travel than the feed.

In completing this arrangement the wheel centres of the original Type H6 machine have not been changed. These were positioned to receive the shortest saw practical, and when in their normal position the wheel rims are but two feet apart. With this close spacing it is possible to feed a maximum width of 24 inches and at the same time return a maximum width of 20 inches, or vice versa, as the stock may overlap without interference. Slabs wider than this will not ordinarily leave the head rig, as it is usually considered poor practice to slab so thickly that a slab of over 24-inch width will be produced from any log.



Outfeed End of Yates Type H61 Horizontal Resaw.

The advantages of a machine of this particular kind will be instantly realized by practical mill men. It materially simplifies the conveyor and transfer system of the mill and reduces to a minimum the floor space required.—Yates Quality.

Australia's Imports of Timber

Australia's imports of timber from Canada during 1912, 1913, and 1914-15 were valued as follows: 1912, £70,922; 1913, £67,982; 1914-15, £17,653. Imports of wood manufactures from Canada during the same years were valued as follows: 1912, £2,850; 1913, £4,077; 1914-15, £3,909. Imports of printing paper from Canada were valued as follows: 1912, £179,173; 1913, £149,050; 1914-15, £122,688.

The imports of timber from the United States during these years were valued as follows: 1912, £1,314,314; 1913, £1,511,665; 1914-15, £1,021,175.

Through the incidence of the war and abnormal marine freight rates the total imports of timber (lumber) into Australia declined from £2,922,578 in 1913 to £2,153,469 in 1914-15, the contraction in values being no less than £769,109. Imports from Canada declined by £50,328, from the United States by £490,490, from Sweden by £115,759, from Norway by £61,958, from Russia (Siberia) by £58,683, and from Japan by £11,123.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Wanted—Quotations on 1¼ in. and 1½ in. Hard Maple lumber. J. H. Connor & Son, Limited, Ottawa, Ont. 15-16-17-18

BASSWOOD AND PINE WANTED.—No. 2 Common and Mill Cull Basswood, 1 in. cull pine, Winter cut preferred. Apply M. Brennen & Sons, Hamilton, Ont. 16-21

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Birch Wanted

WANTED—10 Cars 2½ in. No. 1 Common and Better Birch for Fall delivery. Buffalo Hardwood Lumber Company, Buffalo, N.Y. 14-17

Lumber Wanted

Lumber wanted for various shell boxes—Spruce or other soft woods, all grades ⅝ in. to 4 in. Hardwood 2 in.—all grades. Must be absolutely dry stock. Give width and full particulars. Prices F. O. B. Montreal. Terms cash 30 drys. Address Castle & Son, 200-202 Papineau Avenue, Montreal, P. Q. 16-16

Wanted—Lumber

10,000 ft. Good Hard Maple, free from hearts, first and seconds, 5 in. x 6 in.
5,000 ft. 1 in. Rock Elm, first and seconds.
3,000 ft. 2 in. Rock Elm, first and seconds.
2,000 ft. 3 in. Rock Elm, first and seconds.
Quote price and delivery.

Ottawa Car Manufacturing Company, Ltd.,
16-16 Ottawa, Ont., Can.

For Sale-Lumber

For Sale

We have in Toronto for quick shipment the following among other items:—
75,000 feet 4/4 1st and 2nds quartered white oak.
50,000 feet 4/4 1st and 2nds plain red oak.
100,000 feet 1 in. No. 2 C & B basswood.
50,000 feet 4, 6 and 8 quarter 1st and 2nds chestnut.
We also carry poplar, gum wood, ash, mahogany, cypress and other hardwoods. Write or wire your enquiries, our expense.

Wilson Lumber Company,
16-16 1 Spadina Ave., Toronto.

For Sale

One car 3-in. Practically Clear White Oak, all 12 ft.

Two cars 1½, 2, 2½, and 3 in. No. 1 Common and Better Dry Red and White Oak, all Ohio stock.

The Probst Lumber Company,
15-18 Cincinnati, Ohio.

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal. Que.

Doors For Sale

About eight hundred fir doors, also stock of fir and pine finish. All high class; will sell cheap. Box 436, Canada Lumberman, Toronto, Ont. 16-17

For Sale

25,000 ft. Yellow Birch, 2½ in. No. 2 Common and Better.
115,000 ft. Yellow Birch, 2 in. No. 2 Common and Better.
25,000 ft. Yellow Birch, 1½ in. No. 2 Common and Better.
70,000 ft. Hard Maple, 2 in. No. 2 Common and Better.
20,000 ft. Hard Maple, 1½ in. No. 2 Common and Better.
Well seasoned and in good shipping condition. For Sale by:

JOHN S. EAGLES & CO.,
16 16 St. John, N.B.

For Sale-Machinery

Saw Mill Machinery

Complete equipment for 40,000 capacity mill, including belts, conveyors, etc., with or without boilers and engines. For sale cheap to quick buyer.

St. Maurice Lumber Company,
15-18 Gaspe Harbor, P.Q.

FOR SALE

1—Wicks Gang.
1—Ideal Engine, 13 in. x 12 in.
1—Plain Engine, 16 in. x 24 in.
1—Plain Engine, 5 in. x 7 in.
1—Boiler, 72 in. x 16 in.
1—Boiler, 54 in. x 12 in.
2—Upright boilers.
1—Cookston water heater.
Several steam pumps.

CHAS. PEDWELL,
16-t.f. McVicar, Ont.

Saw Mill Machinery For Sale

Two (2) New Waterous Band Mills.
Two (2) 2½ A. Log Carriages.
Two (2) Gun Shot Steam Feeds.
One (1) Dittbener Band Re-saw.
One (1) New Champion Edger No. 405.
One (1) Standard Two-saw Trimmer.
One (1) Overhead Slat Slasher.
Lath Mill Machinery.
Rolls and Drives.
Transfers.
One Refuse Hog.
Sorting Table.
Filing Room Machinery.
Live Rolls, Boxes, Shafting and Driving Chain.

All of the above is new and was never used

For particulars write to Bayl ss Pulp & Paper Company, Binghampton, N. Y., U.S.A.

Machinery can be seen at any time at Beaupre, P. Q. 14-15-16-17

FOR SALE

Woodworking Machinery

1 Jackson-Cochrane 54-in. Resaw; 1 Cowan 42-in. Sander; 1 Jackson-Cochrane 36-in. Sander; 1 Egan 36-in. single Surfacer; 1 McGregor-Gourlay 2 drum 30- in. Boss Sander; 1 Egan 30-in. 2 drum sander; 1 C.M.C. 8-in. 4 side sticker; 1 McGregor No. 212, 30-in. double surfacer; 1 No. 180 Berlin 30-in. double surfacer; 1 Ballantyne 12-in. sticker.

P. B. YATES MACHINE CO., LTD.,
16-19 Hamilton, Ontario.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Young man, four years experience in sawmill office as stenographer and bookkeeper, desires change. Good references. Box 424, Canada Lumberman, Toronto, Ont. 14-16

CIRCULAR SAW FILER wants position in band saw mill, under a first class Band Saw Filer, to learn the filing. Box 431, Canada Lumberman, Toronto, Ont. 16-21

EXPERIENCED LUMBER WOODS CLERK wishes to make a change. With same company several years. Good references. Box 434, Canada Lumberman, Toronto, Ont. 16-18

MARRIED MAN, THIRTY YEARS OLD, ten years' experience in office work as Accountant, speaking both languages, desires to change, best of references. For particulars write to P. O. Box No. 69, Three Rivers, Que. 16-24

POSITION WANTED : — BY EXPERIENCED OFFICE CLERK:—Timekeeping, Pay Rolls, Shipping Bills, Cashier, Bookkeeping, Typewriting; or general assistant to Manager. Lumbering and Milling plant, Quebec or Northern New Brunswick. "Business," Box 435, Canada Lumberman, Toronto, Ont. 16-16

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

Millwright Wanted

to take charge of a circular saw mill for balance of season and then complete building and installing of machinery in another mill. Yearly job for right party. French and English speaking. The Turner Lumber & Pulpwood Company, Lake Edward, Que. 16-16

Business Chances

For Sale

Saw Mill, 2½ miles. Limits, Houses, Barns, Store, Farm, Railway Siding in yard. Box 432, Canada Lumberman, Toronto, Ont. 16-16.

Timber Tract and Mill

Valuable Timber Tract, British Columbia; nearly 10,900 acres; 60,000,000 feet of timber; on railroad. Local market for mine props. First class mill, 30,000 feet daily capacity. Very attractive proposition. George W. Grant, P. O. 1676, Calgary, Alta. 13-16

For sale or to rent—The long-established business of The Amherstburg Planing Mills & Lumber Yards. Buildings are fully equipped and contain 15,000 feet of floor space and dry kiln. Splendid prospects. Apply to

The J. R. Park Estate,
15-16 Amherstburg, Ont.

VALUABLE HARDWOOD FACTORY AND PLANT FOR SALE

Situated in the centre of the best hardwood district within 115 miles from Toronto. Fully equipped with modern machinery. Hydro Electric system, good railway facilities, can be purchased now at about one-third face value, favorable terms arranged. Local orders, also skilled and other labor available. Could commence operating in a short time. A rare opportunity. Full particulars Box 118, Gravenhurst, Ont. 16-16

Business Opportunity

Wanted immediately a high-grade, experienced man to take charge of all or part of a pine logging and manufacturing operation of good size in Ontario. A fine place for the right man. State full particulars needed for arriving at judgment in first letter. Please do not apply unless you can make good. Box 426, Canada Lumberman, Toronto, Ont. 15-16

Timber Limit For Sale

Thirty-six square mile limit, North Shore, License allows cutting all kinds of timber. Contains Hemlock, Birch, Spruce, Pine, Cedar Ties and Poles, Pulpwood and Hardwood. Railroad runs through part of berth. Cheap operation. Splendid opportunity for small mill. Apply Box 423, Canada Lumberman, Toronto, Ont. 13-t.f.

For Sale—Modern Saw Mill

and 300 Million feet of standing timber in British Columbia, most advantageously located on beautiful lake and main line of Transcontinental Railroad having advantage of $3 per thousand feet in freight rates to best markets on the Continent. Logging and manufacturing conditions ideal and very economical. A fortune for the right parties. Will sell on easy terms and may accept other desirable property in part payment. Principals only.

14-17 Chicago, Illinois.

Miscellaneous

For Sale—Well equipped small seagoing tug, name "Shirley." Marine boiler, condenser, steam anchor winch, etc., 55 ft. x 15 ft. beam. Draft 7 ft. Can be seen at Quebec, care of J. L. Lachance Limited. 15-16

Canadian Portable Houses in France

A despatch recently received from Paris, France, states that the samples of portable houses manufactured in Canada which were recently sent to that country are now on exhibit at the Tuilleries, and are attracting much favorable comment. A Paris Association has furnished these seven houses, and around them are displayed a number of farming implements furnished by the automobile club of France.

AUCTION SALE

In the matter of

"The St. Simeon Lumber Company, Limited"

Of St. Simeon, Que. Co. Charlevoix
In Liquidation

Notice is hereby given that on

Wednesday, August 30th, 1916

At 10 o'clock A.M.

will be sold by public auction at the office of the undersigned, 147 Mountain Hill, Quebec, the following assets of the said Company in Liquidation:—

(a) 10. A property situated in the parish of St. Simeon, County of Charlevoix, known and designated as Nos. twenty-two (22), twenty-two A (22A), twenty-three (23), twenty-three A. (23A), twenty-four (24), twenty-four A. (24A), twenty-four B. (24B), twenty-four C. (24C), twenty-four D. (24D), twenty-four E. (24E), twenty-four F. (24F), twenty-four G. (24G), twenty-four I. (24I), twenty-four J. (24J), twenty-four K. (24K), of the official cadastre of the parish of St. Simeon, first range of the township of Callieres, including wharves, dams, booms, mills, outhouses, machinery, belting and tools, engines and boilers in use of same, and all the other buildings erected on the said lots.
The lot number twenty-four (24) being subject for some part of it to an emphyteutic lease consented by Mauril Tremblay, to Alfred Couturier, Eugene LeBlond, Francois Lavoie, Ludger Bergeron, Chs. Simard before Boulaine, N. P., on the 5th December, 1904, and by Andrew and D. C. Thompson to Victor Imbault before Kane, N. P., on the 8th April, 1897, to Elzear Chamberland and Frs. Hervey on the 13th October, 1896, to Pierre Tremblay on the same day before Kane, N. P., and the lot No. twenty-four K, (24K), being subject for an EMPLACEMENT detached of said lot to an emphyteutic lease consented by Mauril Tremblay to Geo. Gagne before Boulaine, N. P., on the 5th December, 1904:

20. The rights of the Company on the limits actually under license from the Crown by the Minister of Lands of the Province de Quebec, and known under the following names:—
10. "River Malbaie limits No. 2" comprising 27 square miles;
20. "Black River limits No. 1 West," comprising 20 square miles.
30. "Black River limits No. 1 East," comprising 15 square miles;
The licences of the limits bear the numbers 166, 167 and 168 of the year 1906-7, and as the said properties are described in a certain deed of sale by Ovide Brouillard to the St. Simeon Lumber Co. passed before St. Germain, N. P., on the 11th May, 1907;

30. The rights acquired by the said company on:—
(a) A strip of land situated in St. Simeon, forming part of the lot No. fourteen (14) of the 3rd range South-West, township of Callieres, and which is described in a deed of sale by Jos. Tremblay to the St. Simeon Lumber Co. passed before Boulaine, N. P., November 12th, 1911;
(b) The rights to occupy and inundate in perpetuity a strip of land situated in St. Simeon, forming part of lot No. fifteen (15) of the 3rd range South-West township of Callieres, and more fully described in a deed consented by Meride Lavoie to the St. Simeon Lumber Co. passed before Boulaine, N. P., Nov. 12th, 1911;
(c) A strip of land situated in St. Simeon forming part of lot number thirteen (13) of the 3rd range South-West of the township of Callieres, which is described in a deed of sale by Jules Marier to the St. Simeon Lumber Co. passed before Boulaine, N. P., 12th November, 1911;

40. The rights of the said company in liquidation on a part of lot No. 157 of the cadastre of the parish of St. Simeon, and to her consented by Wilbrod Asselin by deed passed before Boulaine, N. P., November 12th, 1911;

50. The rights of the said company in liquidation on an EMPLACEMENT situated in the parish of St. Simeon, being part of the properties known and described under the numbers twenty-one (21), twenty-two (22), twenty-three (23), and twenty-four (24), of the first range South-West township of Callieres, which are described in a deed of sale by Xavier Tremblay to the St. Simeon Lumber Co. passed before Boulaine, N. P., August 24th, 1907;

60. The rights of the company on part of lot No. twenty-four (24) of the first range South-West, township Callieres, as described in a deed of sale by Flavien Tremblay to the said company passed before Boulaine, N. P., February 5th, 1909;

70. The rights and privileges of the said company in liquidation on the lot No. 69 of the official cadastre of the parish of St. Simeon South-West side of the river, consented by and described in a deed of arrangement between D. McLaren and the St. Simeon Lumber Co., passed before Boulaine, N. P., August 24th, 1907;

80. All that tract of land known and designated as the "Location Forestiers ARRIERE CALLIERES" in the county of Charlevoix, containing about 14,150 acres, which is described in a deed of sale by Ovide Brouillard to the St. Simeon Lumber Co., passed before Morin, N. P., February 12th, 1915;

90. 10. All that tract of land situated in the township of Sagard in the county of Saguenay, containing about 7,170 acres, known under the name of BLOC "A" SAGARD, which is described in a deed of sale by Ovide Brouillard to the St. Simeon Lumber Co., passed before Morin, N. P., February 12th, 1915; 20. The rights of the company on the limits under license of the Crown by the Minister of Lands of the Province of Quebec, and bounded as follows: Towards the North-East by part of the township of Dumas, towards the South-East by the limit No. 2 West of Saguenay and Charlevoix, towards the South-West by the division line of Charlevoix and Saguenay, and towards the North-West by the division line of the counties of Saguenay and Chicoutimi, less the part covered by subsidy now belonging to the company known as BLOC "A" SAGARD, leaving an area of 25 square miles more or less, the license covering the said limits dated 1st May, 1915, and bearing No. 244 of the year 1914-1915.

100. The rights of the company in liquidation on a certain property situated in the township of Dumas, in the county of Chicoutimi, forming part of lot No. (14) of the North range of the said township, containing about 21, 6-10 acres, including wharves dams, booms, outhouses and mills, machinery, belting and tools, engines and boilers in use therewith which are described in a deed of sale by Ovide Brouillard to the St. Simeon Lumber Co., passed before Gohier, N. P., Nov. 20th, 1915;

110. The rolling stock in use with the above limits;
The properties above mentioned and the rolling stock will be sold en bloc and as one sole item;
The goods and moveables in the above matter will be sold separately and each item as follows:

(b) The stock-in-trade as found in the stores of the company, as per inventory, $14,000.00.

(c) The book debts and credits as per list, $19,872.70.

(d) The refuse lumber and culls about 408½ cords.

(e) The wood on the banks of the rivers, lakes and streams, also in the water in the condition it is at time of the sale unless it has reached its destination before or it is being driven or on way of drive.

The sale will be made separately for items A, D & E, and awarded to the highest bidder, and items B and C will be sold at so much in the dollar.
The sale of the item A will be made at an upset price of $125,000.00.
The buyer of item A to deposit in the hands of the liquidators an accepted cheque for $25,000.00, and which will be forfeited in the event of his failing to pay the balance of the amount of the purchase price which becomes due and payable on the production of the title deeds.

TERMS: "CASH"

The limits can be examined at any time and the store will be opened for the stock inspection on AUGUST 26th, 28th, and 29th, 1916.
The inventory, the list of book debts, and the title and certificates regarding the properties can be examined at our office.
The above limits comprise about 33 miles of Freehold property and about 55 miles under license of the government.

LEFAIVRE & GAGNON,
Joint Liquidators.

Review of Current Trade Conditions

Ontario

The lumber trade in Ontario continues in the peculiar state which has characterized it for some weeks past. The demand cannot be said to be good. It is best described as patchy. The supply of lumber, however, is short, on account of the scarcity of labor at the mills. Stocks are a great deal shorter than is usual at this time of year. The result is that wholesalers are finding it increasingly difficult to obtain such stocks as the limited amount of trade requires. The prospects of the mills in northern Ontario securing a sufficient supply of bushmen for next winter's operations are very slim. Some of them have appealed to the Government for assistance, but, so far as we can learn, the Government claim to be unable to give any help. We do not believe that relief can be expected from that quarter. The prospects for next year's cut are therefore anything but good. The market generally is strong, with an average fair demand.

White pine stocks have been much reduced of late in quite a number of lines, chiefly in dry stock, and they are likely to be reduced even more. Most of the mills are having great trouble in continuing operations. Many of them report that they do not know at night time each day whether they will be able to run the mill during the following day. Scarcely any of them can give prompt shipment. At most of the mills the men are doing double duty whenever possible, the crews working both upon running the mill during the day and loading the cars at night.

There is no feature worthy of note in regard to the demand. As usual at this time of year it is quiet. Wholesalers and retailers, however, are expecting that some improvement will develop before long. There is no expectation of a big trade during the fall, but the prospects are for a fair demand which will show some increase over present conditions. Wholesalers and retailers will find that they must be patient with the manufacturers and the railroads for some time to come. The railway companies are also up against the labor situation and on account of the exceptional congestion of traffic at Allandale, deliveries from northern Ontario points are greatly delayed.

The hardwood trade, like that in soft woods is very spotty, but this is always to be expected during July and August. There is no surplus of stock, and prices are about as stiff as they have been. Moreover, the prospect is that they will advance. The threatening strike of railroad employees in the United States is a factor that should be watched carefully. The effect, if a strike is brought about, would be to advance prices greatly, on account of the stoppage of deliveries. Flood conditions in the south have retarded cutting operations to some extent, making a shortage of logs, which is an added factor in the firmness of the market, in the face of a quiet demand.

Eastern Canada

There is no change to report in trade conditions at Montreal. The volume of trade is only moderate, most of it being for shell box business. Wholesalers are expecting advanced prices on account of the increased cost of labor and camp supplies. The export trade to the United States shows a little improvement. Trade with the United Kingdom has fallen off to some extent, largely on account of the uncertainty in the freight situation.

The demand for shingles at Boston is fair, but there is not much in the way of business in large lots. Most of the current transactions are for white cedars, the best of which are bringing about $3.50. Red cedar shingles are selling at about 40 or 45 cents above the prices for white cedars. Lath are firm, quite a number of enquiries having come from large yards. Offerings are not so large as a short time ago. There is a good demand for spruce lath which is bringing about $4 for the best grades.

The deal market at St. John, N. B., shows no more activity than it did a fortnight ago. No shipments are being made, buyers preferring to pile such stock as they have purchased, and to wait until they can get prices that will give them a profit. At present prices they would not be able to get their money back. The American market has gone very flat and two of the largest mills at St. John which were sawing for this market, have been closed down since the first of August. Freight rates for transatlantic and coastwise shipments continue high and accommodation is scarce. Local trade at St. John is very quiet. Low grade stocks are easier in price. The only line of business that seems to have any real life in it is the box industry.

United States

Probably the most important feature in connection with the lumber trade situation in the United States is the great reduction that has been brought about in the output of the yellow pine mills, together with reports from many parts of the country to the effect that the demand for this class of stock is increasing. It is believed that stocks of lumber in buyers' hands are depleted in the great majority of cases and that the recent improvement in the demand is an indication of a fairly general and well sustained buying movement. Those who hold this opinion believe that the lumber market has done as much easing off as can be expected, and that those who were holding back until the bottom was reached are now laying in supplies. The latest Southern Pine Association trade barometer shows that orders during the week exceeded normal production by 42.32 per cent. Compared with the preceding week the orders showed an increase of 12.18 per cent. The actual production for the week was 17.59 per cent. below normal and shipments were 1.68 per cent. below normal. All of these conditions are healthy from a market point of view. There is still an active enquiry for yellow pine car material and the increasing use of mill construction buildings is widening the market in a very satisfactory manner. Eastern retail yards are still buying carefully, but line yards in the middle west are commencing to stock up while prices are low.

The northern pine trade has been feeling the natural effects of mid-summer weather. Reports from Minneapolis state that country yards are counting upon a good trade a little later on, but are not yet laying in stocks to any extent. Low grade stock is moving well. Prices are steady and the outlook is for continued strong prices during the remainder of the season. Trade conditions in the lumber business are closely associated with crop conditions and as the outlook in the latter regard is excellent there is good cause for encouragement regarding the lumber trade. The demand for northern pine at Chicago is steady and prices are unchanged. An increased demand is expected in the very near future. Low grade stocks are moving well and pattern lumber is also in fair demand.

Hardwoods show no important changes during the past fortnight. Furniture factories are renewing their purchases to a small extent and there is some trade in other lines which gives a fairly active appearance to the whole market. Manufacturing plants in all parts of the country are busy, most of them producing to their capacity, so that the demand for hardwoods is likely to continue. Stocks throughout producing territories are not heavy. Many producers have had difficulty in securing sufficient labor and some have been obliged to shut down. It is even expected that the labor situation may produce an upward price tendency. Birch and maple are in good demand and prices are strong. There is also a little revival in the demand for oak.

Great Britain

Much uncertainty prevails in connection with the lumber trade at London, a result chiefly of the unsettled condition of the freight market. Very little is being done in the way of speculating in future stocks, most merchants being quite content to delay until the position has been cleared up to some extent. Official requirements, however, are still consuming large quantities. The continually increasing population of prisoners in England is again resulting in a demand for huts, which will require a fair amount of material for their construction. Arrivals of stocks are extensive and values continue high, comparatively speaking, although there has ben an extensive drop of late. There is, however, a tendency towards lower prices, especially for lower grades and the smaller sizes. Deliveries at London docks for the week ending July 15 amounted to 6,105 standards, as compared with 7,423 standards during the corresponding week of last year. At Foy, Morgan & Co.'s recent auction sale a lot of first, second, and third St. John spruce, 2 x 4/6 inch, 15/17 feet, was sold at £22 5s. St. John pine, 3 x 7 inch, 6/18 feet, first, second, and third, red, brought £23. Quebec spruce, 3 x 5/6 inch, 9/16 feet, firsts, sold at £23 5s per standard.

At Liverpool trade has been rather quiet, and prices for the cargoes that have arrived have varied considerably. Shippers are showing a tendency to wait, expecting higher prices, which it is generally thought are inevitable. Freights have again advanced, especially for September loading, 350s having been refused. At Manchester there is a moderate volume of trade in progress, but it is greatly hampered by delays at the docks. Prices, though somewhat lower,

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

have not shown any slump. The better class of spruce deals from Campbellton, N.B., Quebec, etc., are firm at the latest prices, which vary from £27 for the narrowest scantlings to £32 10s ex quay.

There has not been much business at Glasgow during the past fortnight. Several arrivals of spruce and yellow pine deals have been recorded, including two or three full cargoes, the latter mostly on contract. Transactions from the ships' side have been rather slow, and most of the consigned stock is being stored on importers' or shippers' account. Buyers are still nervous about the freight situation, and are only dealing on a strictly hand-to-mouth basis. Stocks have accumulated to some extent, but prices are not noticeably weaker. Stocks in second hands are exceptionally light, and any demands which arise will have to be filled almost entirely from importers' stocks in public yards.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Trade—Everybody Marking Time

St. John, N. B., August 7th; (Special to the Canada Lumberman): There has been positively no change in the deal market at St. John during the past fortnight, everything in the way of shipments is at a standstill, and, so far as can be told, shows no signs of changing. The buyers refuse to purchase and are shipping no deals; preferring to pile off cars into yards, there to be held until they can sell at a price which will give them a reasonable profit. They cannot sell today at a price which would give them their money back. Stocks at Liverpool and Manchester remain about the same as last year, but conditions for using stocks in England are not nearly so favorable as a year ago. Labor is at a premium and many wood users are out of business, and will be until the end of the war.

Two of the largest mills at St. John, Messrs. Stetson, Cutler and Company's are idle, having closed down on the 1st of August, and, although well supplied with logs, they do not know when they will again begin sawing. These mills were sawing largely stock for the American market, for which, at the present time there is very little demand.

Another great trouble is the high priced and scarce freight accommodation. The market in New York will not stand a high freight rate today, and vessels refuse to take less than $6 per thousand, which is about twice the usual rate.

The building trades at St. John are also stagnant, but not to the same extent as the shippers. Very few contractors are busy, and those who are, have only small works, and repairs from place to place. Prices for low grade stocks are easier, the mills being overstocked with refuse, which is selling from the country mills at about $9 free from cars. Usually we begin to feel a better tone after this month, and it is to be hoped that this year will be no exception.

Laths and shingles are in the same condition as the rest of the market.

The box trades are the only ones who are busy in the lumber trade, and they surely deserve it, as they have had a good number of years of small profits and bad conditions.

Montreal Trade on a Quiet Basis

Montreal, August 8.—(Special to the Canada Lumberman.)—Practically no change in market conditions has taken place since the last report. A moderate trade is being transacted, with a few orders on shell box account. Wholesalers emphasize the probability of a rise in values, the cost of labor and camp supplies being serious factors in this situation. Collections in Montreal are reported to be poor, but in the province they are fairly satisfactory.

There is complaint of a shortage of cars, especially on the Intercolonial.

Business with the United States has picked up slightly. The break in the Lachine Canal disorganized water shipments for a time, but the condition is now practically normal, the break having been temporarily repaired.

There is no alteration in the pulp and paper markets. Sulphite is still in good demand, with the supply on the short side. A considerable amount is still being sent to Great Britain. The ground wood market is also strong. Newsprint is firm, and is likely to continue so for some time. The decision of the New York papers to cut down the size of their Sunday editions is evidence of the increasing difficulty of obtaining supplies and of the substantial increase in prices.

Lumber exports to the United Kingdom have decreased. The state of the British market just now is not encouraging, buyers being influenced by the uncertainty of the freight situation. The prohibition of building operations in the United Kingdom except under Government license is also calculated to affect Canadian shipments adversely. The Government takes the view that only absolutely necessary buildings, including dock and similar work, can be allowed. Rates show little fluctuation, but there is no telling when they will rise or fall. Space is by no means plentiful for lumber, other commodities with a preference going forward in large quantities. Several lake vessels of the Canada Steamship Lines have this season been engaged in shipping lumber from Montreal, Three Rivers, Quebec, and Rimouski to United Kingdom ports. The cargoes ranged from 530 standards to 872 standards of deals. Dock labor is scarce.

Mr. George Kersley, who does a large business in veneers, reports that the piano and furniture industries in Ontario and Quebec are in a satisfactory condition. He has just returned from a visit to the chief woodworking points in Ontario, where he found the factories well supplied with orders.

United Kingdom Imports for Six Months

Imports into the United Kingdom during the six months ending June 30, 1916 and 1915 included the following.

	1916		1915	
	Quantity	Value	Quantity	Value
Wood and Timber (hewn)—	Loads	£	Loads	£
Russia	11,747	49,706	1,485	4,203

Quebec Cullers' Report

The following comparative statement of timber, measured and culled to date, is furnished by the Supervisor of Cullers' office, Quebec, P. Q., under date of August 4th:

	1914.	1915.	1916
	Cubic Feet	Cubic Feet	Cubic Feet
Waney White Pine	481,560	341,680	118,960
Red Pine	1,040	.....	.....
Oak	290,280	90,880	221,400
Elm	299,280	46,840	69,440
Ash	680	840	1,680
Birch and Maple	50,800	48,880	46,880

A severe electrical storm and cloudburst, which recently occurred in New Brunswick, resulted in a sudden rise in the St. John River. The river came up about 12 feet at some points. A result of this is that some of the small drives on the Tobique and elsewhere that were making slow progress came out rapidly and were driven to the booms at Douglas.

An extensive exhibit of timber products from British Columbia, which will be installed permenently at McGill University, has been almost completed, under the supervision of Mr. D. Roy Cameron, district inspector of forests, Kamloops, B.C., and Mr. Nelems. of the Forest Branch.

Cost Accounting in the Factory

By J. D. Clark

The operator of a planing mill, dimension mill, or other woodworking plant where "jobs" rather than regular work are handled, naturally finds the cost-keeping problem more difficult than is confronted in the furniture factory which is turning out the same goods right along. Of course, the problems of the furniture man are not simple, because the number of items produced is great enough to suggest the necessity of discriminating in figuring costs, and it is needful to know just how much expense is attached to the production of each item.

On the other hand, the planing mill which gets work by bidding on it in competition with others must find out to the last cent how much the production of the job involves, for the reason that it is only logical to learn the results of each operation, if for no other reason than to determine whether the original estimate was correct, and as a guide against possible repetition of errors. So also with the dimension factory which is cutting lumber to size for use in some other woodworking plant. If it has a large cutting order there is a good chance of overlooking certain items and of assuming that a price which is really insufficient to pay all the charges will cover the requirements.

The dimension proposition is newer than the planing mill, and, in view of the rapid growth of this kind of business it may be of interest to other woodworkers to explain how a model system of this kind is operated. The plan is not put forward as ideal, but is certainly a big improvement over the rough-and-tumble, hit-or-miss methods which often prevail, especially when the dimension business is operated in connection with a sawmill, as is usually the case.

In the first place, the correct basis of the proposition is obtained by figuring the cost of the lumber at the price which would be paid if the manufacturer went into the market for it. In a lot of cases where low-grade lumber (which is not easily sold) is used in dimension manufacturing, the tendency is to disregard the value of the material. Obviously this is not a correct method of procedure, since the object should be to sell the product at a profit, and a price which does not take account of the original intrinsic value of the raw material is not properly ascertained.

If the material is kiln-dried, as is usually the case when dimension stock is manufactured to order, the cost of drying is included, this averaging about $3 per 1,000 feet. That is the usual custom charge, and while an individual manufacturer operating his own kilns should be able to do the work for somethisg less, it will not miss this figure much by the time the cost of handling, which is a big item in kiln-drying operations, is taken into account.

The system referred to is handled by means of a loose-leaf ledger, each job being figured on its own page. The idea is to enable the manufacturer to go over the whole proposition and see just how much he has made or lost on each job. This is a big advantage, compared with the ordinary system of grouping expenses without reference to their application to various jobs.

The first item on the page is rough lumber. The date and quantity of each kind and grade of lumber delivered for dimension manufacing are shown, together with prices, enabling the value of the material to be calculated accurately. As suggested, the cost of kiln-drying is included, this being added to the market price of the stock, without the K. D. feature being taken into account.

The labor costs involved in the work are then figured in detail, columns being provided for "Cross-cutting labor," "Ripping labor," "Resaw labor," "Inspecting labor," and "Bundling labor." This, it should be noted, applies to labor expense only, a separate calculation being made to cover machine expense. The labor costs are determined by the use of time-cards for each employe, whose records show just how much time was put in on each job, and therefore what proportion of his wages is chargeable to that job. The jobs, it should be added, are handled in the dimension plant by number only, so that none of the hands is advised regarding the destination of the material.

The labor expense is handled more easily in this particular plant by reason of the fact that the machine hands and inspectors are paid by the piece, so there is no difficulty about figuring the actual cost which is to be included on each job. The inspection feature is, of course, important in this kind of work, as one of the troubles which many plants have in making good with customers is due to the fact that a lot of material is shipped which is not up to specifications. This means that in order to get results the inspection work must be properly taken care of. Inspection in this case does not mean technical inspection for the purpose of determining grade, but is used to learn whether the material is clear and whether the general character and appearance of the stock is up to the specifications. The plan of paying so much per thousand pieces for inspection suggests a possible tendency to speed at the expense of care; but of course any complaints regarding the stock are immediately put up to the inspector, who for this reason is bound to be careful in going through the stock before it is bundled and shipped.

Possibly the most interesting feature of this cost sheet is the figuring of machinery expense. In many plants no attempt is made

Camp Groceries

You can always be sure that we have at all times a good supply of everything that is needed by the cooks in the camp.

Buying in large lots, we can quote the lowest market prices which are prevailing at the time of inquiry.

We solicit a share of your business requirements and will gladly quote and send samples on request.

to analyze this, power and machinery expense being grouped and applied against all of the work done by means of some general or overhead charge. But there is as much individuality in machines as there is in men, and the plan used in the plant now under consideration, whereby the cost of operating each machine for each job is carefully calculated, seems to be by far the better system.

In the first place, the rate is determined by figuring the total capacity of the machine per year—that is, the normal number of hours it may be expected to operate. This is based on actual tests, and takes into account loss of time for repairs, adjustments, etc. Then the value of the machine is considered, and the expense represented by interest, depreciation, and other charges is figured. Tests are also made to determine the power consumption, and if electric motors are used the current consumed can be actually measured and a definite figure secured for this. If steam power is used, the power being transmitted from the engine by mechanical means, the distribution of the expense would, of course, be harder to figure, and might have to be applied on a pro rata basis.

The point to be kept in mind, however, is that the object of cost accounting should be to get away from the use of general charges as much as possible, and to substitute individual items, because it is in the calculation of those general figures that errors are introduced, due to the actual variations in the capacity, efficiency, etc., of various machines. Putting each machine, each man, and each job on a basis determined by the facts in each case is the only logical plan.

In the plant referred to the rate per hour for each machine is calculated on the basis suggested, so that by having a record of the number of hours each machine works on each job the cost of the machine time applicable to it may be entered with the assurance that it will be very close to the correct data.

As pointed out above, the rate for machine time is based on the assumption that the time used will be normal. If the plant happens to run overtime, this, of course, reduces the cost to the manufacturer, but the normal rate is used, as it would be unfair to allow a customer whose work was done at night a lower rate than that applied to the manufacture of goods in regular hours. Such an unearned increment as this, it is also worth noting, might serve to offset unexpected losses of time due to breakdowns of more than the usual importance.

The record for the finished stock is analyzed with reference to the number of pieces produced, the amount of lumber used, the waste, and hence the net results in thousands of feet. The sales price is indicated on this calculation, with the sales value in terms of feet.

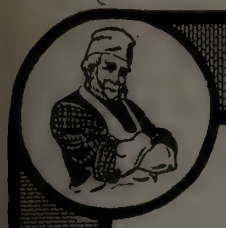
In this particular mill an effort is made to dispose of the waste and offal of the plant, and a careful record is also kept in this respect. It shows the character and quantity of all the material, with the inventory value, this being credited to the job against which it is figured. These figures are unusually valuable, because they serve not only as an inventory of the waste (which otherwise would be hard to secure), but also provide a basis for determining the average waste to be allowed for in the manufacture of the finished product.

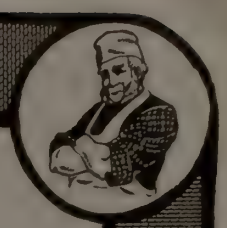
The whole job is recapitulated on the same sheet. The gross sales value of the finished stock is shown, together with the allowances made for freight and other items. Space is provided to enable the freight to be figured, as many of the sales made by this concern are on a basis of delivered prices, and it is necessary that the transportation cost be shown here in order to enable the net results of the job to be determined. The net sales value, after making the deductions indicated, is then entered.

The next item, determined from the figures already entered on the sheet, is cost. This includes lumber, which is analyzed as follows: Total cost of lumber sent to sawyers, less rough lumber laid out or left over; gross lumber actually used, less shorts and reusable offal produced. The result of this calculation is the net cost of the lumber. The manufacturing expense is then figured, the items here being as follows: Cross-cutting labor, cross-cutting machine cost and burden; ripping labor, ripping machine cost and burden; resawing labor, resawing machine cost and burden; inspecting labor; bundling labor; miscellaneous labor; loading labor; hauling labor and expense. The total thus secured gives the total manufacturing and shipping cost, including the cost of the lumber shown above.

The total cost of the product shipped, which means with the freight allowance included, is then secured by adding the lumber and manufacturing cost, and the result is compared with the net sales value realized (already calculated) to determine the gross profit or loss on the order. This is gross for the reason that the general selling expenses, which are figured in percentage on the total sales, must be deducted. After this is figured the result is the net profit or loss on the job.

One other calculation which is made—and one that would be interesting if available to every woodworker—is to show the correct price based on these cost figures. The total cost shipped is entered, plus selling expense, plus cash discounts, plus freight allowance, the result being the correct delivered price. That enables the sheet to be referred to from time to time when repeat orders are secured, to insure the right quotations being made on the job.—The Woodworker, Indianapolis.





CAMP FOOD

A whole lot depends on the food your men get to keep them in the glowing health necessary for strenuous camp work. Their food should be made from the best flour it is possible to secure.

Cream of the West Flour

the hard wheat flour that is guaranteed for bread

has the reputation of being the most wholesome, nourishing flour on the Canadian market. Lumber camps are learning more and more, the best is cheapest in the long run.

Your horses need special camp feed, too. Our Crushed Oats, Mixed Crushed Feed and Chop are the very finest grades of feed for camp use. You'll notice the difference in good work done by your horses in a short while after using these products.

Stationary Engineers' Supplies on Exhibit

An attractive exhibition was held in Montreal recently in connection with the annual convention of the Canadian Association of Stationary Engineers. Belting, packings, and fire hose of all kinds formed the main proportion of the exhibits.

Sadler and Haworth, of Montreal, had a decidedly novel method of demonstrating the quality of their "Amphibia" waterproof belting. A belt was fitted to a shafting and run continuously through a tank of water, so that visitors could judge of the validity of the claims made. A tanned skin showing the part of the leather used in making a belt was shown, together with various lines of belting and many samples of mill supplies, such as dressings, fasteners, and lace leathers.

Darling Brothers, Ltd., Montreal, showed several appliances, including centrifugal and rotary pumps and Webster heating system.

The Dunlop Tire and Rubber Goods Company, Ltd., Toronto, made a feature of their Gibraltar red special belting, and also had on view several lines of packings and fire hose.

The Garlock Packing Company, Hamilton, exhibited many varieties of steam, hydrant, and other packings. The company are exclusive packing manufacturers, and report a large increase in business.

The booth of the Gutta Percha and Rubber Company, Ltd., Toronto, showed many of the company's well-known brands. Belting, packing, fire hose, rubber tiles, and sheet packing were well displayed.

The James Morrison Brass Manufacturing Company, Ltd., Toronto, had a well-arranged exhibit, containing valves, locomotive injectors, steam regulating and safety valves, etc.

Why Lumber Dealers Should Know How to Read Blue Prints

I will tell what I think of a dealer being able to read blue prints or having someone in his yard who can do it. One day a woman came to my office with a set of blue prints for a house she wanted to build. She asked me if I could make up the bill of material from the plans, and said she had called at both other yards in the town to have this done and was told at both places that she would have to get a carpenter to do it. I told her I had a man who could take off the bill. I called in the young man, set him to work, and in a couple of hours he had the bill all ready with the prices. She asked me if she could have it. I asked whether she thought it would be fair after we had spent a couple of hours on it, to let her take it to our competitors for them to figure against me, when they had been unable to make up the bill. She agreed that it wouldn't be. I offered to sell her the lumber, let her then take the bill to whoever she might want to, get estimates, and if any prices were out of line I would adjust the matter to her satisfaction. She said, "Well, I guess your prices are all right; just take the order."

That set of plans had been sent to the woman by a ready-cut house concern, or a mail order house. They made her a price on the material bill, but did not, of course, send her the itemized bill—that isn't their way of doing things. Two of the lumber dealers in her town couldn't make up the bill of material. They had no chance to get the business. The other dealer, the live wire, could make up the material bill and he got the order.

And listen—his price to the customer, at his regular retail prices, were lower than the ready-cut house people had quoted her.

This proves that it is easy for the local dealer to get the business if he knows how to figure. The mail order houses and the ready-cut house concerns send out plans. They send them out broadcast. They quote a lump sum price for the materials. They know if the local dealers have a chance at the itemized bill the lumber will be bought at home.

Every lumber dealer should learn to read blue prints.—The Retail Lumberman.

Decreased Trade in Lumber

The lumber trade in France during 1915 was affected unfavorably by the war conditions. While the consumption of wood for the construction of buildings was comparatively small, owing to the crisis in the building trade, there were large orders placed by the military authorities and by contractors engaged in work for the Government. On account of the abnormal oversea freight situation the congestion of the home ports, the extraordinary rise in freight rates, and the high rate of exchange, the foreign trade, both as to imports and exports, fell off as compared with the previous year, and the prices were considerably increased. The imports of wood for construction purposes in 1915 were 380,805 metric tons, against 821,920 tons in 1914; for cabinetmaking, 14,209 tons, against 63,208 tons; and staves, 26,076 tons, against 55,755 tons. The exports during the same periods were: Building wood, 50,003 tons, as compared with 221,508 tons, and all other varieties, 658,724 tons, against 873,455 tons.—United States Commerce Report.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

EDGINGS

Ontario

The planing mill belonging to Ewing & Murphy, Limited, 20 Cameron Street, Toronto, Ont., was recently destroyed by fire. The loss, including the machinery, amounted to $12,000.

Kutschke & Son, Limited, have been incorporated with head office at Pembroke, Ont., and capital stock of $40,000, to carry on business as lumbermen and dealers in lumber and wood products.

The Pine Lake Lumber Company, Limited, has been incorporated with head office at Pickerel Landing, Ont., and capital stock of $60,000, to carry on business as lumbermen, timbermen, manufacturers of timber, logs, wood, etc. The provisional directors are F. H. Hammond, and H. B. Palen.

The Abitibi Pulp & Paper Company, Limited, report that their loss in the Northern Ontario bush fires was fully covered by insurance, and operations were only interrupted for a comparatively short time. The company lost about 20 houses at Iroquois Falls, together with 20,000 cords of pulpwood. Their limits suffered only slightly and the interruption in the operation of their plant was caused by the destruction of their stock of pulpwood ready for the mill.

The sawmill, stave mill, heading mill, hoop mill, planing mill, machine shop, dry kilns and other buildings comprising the plant of the Fesserton Timber Company, at Fesserton, Ont., were completely destroyed by fire at about midnight on August 5th. The loss included four cars of lumber which had been dressed in transit, two cars of timber, two cars of 1½ inch hoop plank, one car of heading, one car of staves and a quantity of other material, all of which had been accumulated on account of the great scarcity of labor. If the company had had a sufficient staff of employees they would not have accumulated so much material in the neighborhood of the mill. In their dry kilns they also had a large quantity of staves and heading which were undergoing treatment. A number of wagons and other equipment were also destroyed. The fire was confined to the boundaries of the fire limits around the plant, none of the stock piled in the yard having been destroyed. In the yard the company have some 3,000,000 feet of lumber, 2,000,000 staves and other manufactured stock. The loss by fire amounts to about $80,000, which was partly insured. Mr. W. W. Carter, president of the company, has not definitely made up his mind regarding rebuilding, but it is expected that a new plant will be built during the coming winter.

Eastern Canada

D. Cyr & Frere, Ste. Rose, P. Q., have been registered to carry on business as sash and door manufacturers. Those interested are J. M. Damien Cyr and Horace Cyr.

The woodworking plant belonging to Wallace & Robinson, Lake Street, Waterloo, P. Q., was recently destroyed by fire. The damage was partially covered by insurance.

J. F. Gerrity, Bangor, Me., and Frank Newton, Boston, Mass., have purchased 3,500 acres of spruce and fir stumpage on Campobello Island, N. B. They have not yet announced any plans for developing the property.

Plans are under consideration for doubling the capacity of the ground wood mill of the Ouiatchouan Falls Paper Company, Ouiatchouan, P. Q., of which Mr. J. E. A. Dubuc is manager. This will give the plant a capacity of one hundred tons per day.

P. T. Dodge, of the International Paper Company, during an enquiry by the Government at Washington, D. C., recently stated that new paper miills which his company intends to build will be located in Canada, as a result of the present tariff situation.

The Provincial Lumber Company, Limited, has been incorporated with head office at Montreal, P. Q., and capital stock of $20,000, to carry on the business of lumbering and the lumber trade in all its branches, also manufacturers and dealers in logs, pulpwood, etc. Those interested are C. J. E. Charbonneau, B. Melancon, G. N. Clermont, I. J. Labrosse and A. Turgeon, all of Montreal.

A report from St. John, N. B., states that the Partington Pulp & Paper Company completed its rafting operations at the mouth of the Naskwaak River, for the season of 1916, on August 4th, 16,500,000 feet having been rafted, which will be sent to St. John to be manufactured into pulp at the Partington mill. Driving conditions on the Nashwaak have been good and very few pieces have been left in the river.

Western Canada

The Valley Lumber Company, Limited, Winnipeg, Man., has been incorporated.

The lumber yard of the Revelstoke Lumber Company at Swift Current, Sask., was recently destroyed by fire.

Negotiations are under way for the sale of the properties of the Swan-

son Bay Forests, Wood Pulp and Lumber Mills, Limited, to a company to be known as the Empire Pulp & Paper Mills, Limited.

A four-saw shingle mill is to be opened about the middle of August at Avola, B. C., by Mr. Tait, of New Westminster.

Work is about to start on the erection of a lumber mill to cost $100,000 for the Alberta Lumber Company, Vancouver, B. C.

The Johnstone Straits Timber and Trading Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $500,000, to carry on business as timber merchants, sawmill proprietors, and as dealers in timber and wood of all kinds.

The Marsh-Hutton-Powers Company, New Westminster, B. C., have applied for a lease of city water front near Lulu Island Bridge, in order to erect a shingle mill. If the lease is granted they state that they will immediately commence the erection of the mill.

Cook's mill at Dennison, B. C., which has been closed down for many months, has resumed operations, with a capacity of about 30,000 feet per day. The plant is being operated by the Britiish American Lumber Company of Vancouver, on timber obtained near Gifford, B. C.

The Canadian Exporting Lumber Company, Liimited, have been incorporated with head office at Victoria, B. C., to carry on business as timber merchants, sawmill, shingle mill and pulp mill owners, loggers, lumbermen and lumber merchants in all or any of their branches.

Sealed tenders are being received by the Minister of Lands for B. C., until the 23rd day of August, 1916, for the purchase of License X683, to cut 1,511,000 feet of Douglas fir, cedar and hemlock on two areas adjoining Lots 501 and 513, Maurelle Island, Sayward District. One year will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for B. C. until the 23rd day of August, 1916, for the purchase of License X690, to cut 1,000,000 feet of cottonwood, and 5,000 cords of posts, on an area adjoining Lot 491, Goat River, Kootenay District. One year will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for B. C., until the 23rd day of August, 1916, for the purchase of License X663, to cut 1,200,000 feet of spruce, balsam, birch, poplar, cottonwood, cedar and jack-pine, on an area adjoining, S. T. L. 10037P, situated two miles northwest of Eddy, Cariboo District. One year will be allowed for the removal of the timber.

The Retail Lumbermen's Purchasing Agency, Limited, have secured an extra-provincial license with head office at 704 McIntyre Block, Winnipeg, Man., and provincial office at the Credit Foncier Building, Vancouver, B. C. The capital stock of the company is $50,000, and H. K. Agnew, Vancouver, B. C., is attorney. The objects of the company are to carry on the business of lumbering in all its branches and as manufacturers and dealers in logs, timber, lumber, wood, poles, ties, pulp, etc.

The East Kootenay Lumber Company, Limited, Jaffray, B. C., report that the recent loss of their sawmill by fire was not so serious a matter to them from a business point of view, as the daily press led one to believe. Instead of a total loss of their plant at Jaffray, they lost their sawmill only, which had a capacity of 80,000 feet per day. They saved their planing mill and lumber yards. The loss on the plant was covered by insurance and the company have two other mills operating at Ryan and Cranbrook. As it would be impossible to complete a new plant in time to be of any use this season, they will not build immediately, but will probably install a couple of portable mills to saw out the logs they have on hand at Jaffray. Later on, they hope to erect an up-to-date plant, capable of cutting at least 100,000 feet per day of ten hours and equipped to run night and day. This plant will be equipped with band saws and resaws.

A report from Washington, D.C., states that the Interstate Commerce Commission has suspended from August 1 to November 29 the freight rate advances proposed by the Maine Central and other railroads on lumber and other forest products in carloads from points in Maine and Eastern Canada to various destinations in New England and Eastern New York. The present rate from Vanburen, Fort Kent, and other points of origin in Maine, taking the same rates to Harlem River, New York, is 18 cents per 100 pounds. The proposed rate is 21½ cents. Rates to other destinations would likewise have been increased ½ to 3½ cents per 100 pounds. The commision will conduct an investigation into the reasonableness of the proposed increases.

The auction sale of no-mark and mixed logs rafted by the St. John Log Driving Company took place recently at St. John, N.B., the sales being as follows: Usher Miller, spruce deals, $15; spruce battens, $10; pine, $8.50, gross scale; Murray & Gregory, cedars, $9.25; York and Sunbury Milling Company, hemlock, $8.25.

J. H. Turnbull, representing the Alberta Farmers' Co-operative Elevator Company, recently visited Vancouver in order to enquire into the possibility of establishing a direct trade between lumber manufacturers in British Columbia and Prairie Province consumers.

We handle

Everything in Lumber

We can offer at very attractive prices, if interested, the following:

50 M 1" No. 1 Common & Better Birch

This Valuable Book sent all Belt Users for the asking

THE BELTING MANUAL, a hand book of 96 pages, substantially bound, is the most complete and concise book published on belt transmission. It tells

—how to select belting.
—how to install, lace and care for belting.
—how to make belting endless on the pulleys.
—how to find the width, speed and horse-power of belting.
—scores of other "hows" which are constantly coming up in your Power Transmission problems.

We want to send a copy of this book to every Mill Manager, Superintendent, Purchasing Agent, Foreman, Master Mechanic, Engineer or others who are actually responsible for the selection, installation and up-keep of belting equipment.

If you haven't a Belting Manual write us on your business stationery and a copy will be sent by return mail.

Canadian Made Locomotives

There is no need to go outside of the Canadian market in order to obtain the best logging locomotives. We have been specializing in this line for fifty years. You will find the design of our locomotives complete and the sturdy construction equal to every test of the severe service of logging operations.

Repair parts can always be had on the shortest notice.

This engine is 13½ ins. x 18 ins. and weighs 35 tons.

Grey Iron Castings—any size or shape—ordinary or intricate—made promptly. New foundry, splendidly equipped We would be pleased to quote on castings—singly or by contract. We also make drop forgings of all descriptions.

MAY WE SEND YOU SPECIFICATIONS?

Canadian Locomotive Company, Limited, Kingston, Ont.

Taylor and Arnold Ltd., Sales Agent, Montreal and Winnipeg

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa, Deputy Minister.
December 20th, 1912.

A Successful Dry Kiln

Here's what a manufacturer of pianos and organs says of a

Sturtevant Kiln:

Trade Mark

"We have two dry-kilns which are operated in this manner, one along side of the other; one in which we place the green lumber that is shipped us, what is usually called shipping dry. This stock is all steamed before the suction fan is placed on it. The other kiln we use for lumber that has been on stick on our yard for from one to two years, and on this we do not apply any steam, simply running it through in about ten days for immediate use. The green lumber, however, in the other kiln is steamed several days and is put through drying apparatus for about three weeks before it is taken out. We have never had any case hardening using this method, neither have we had any warping, in fact, we are perfectly satisfied with the results."

We can quote you dozens of cases where our Kilns are giving excellent service.

Talk it over with one of our drying engineers or get catalog 220-C.

Sanitary Steel Bunks

Double Deck Bunk No. 171

Black Japan Finish. 1½ inch angle-iron frame supported by strong steel braces. "Alaska" patent twisted link fabric attached to frame by oil-tempered helicals at each end, making very strong, resilient and comfortable bed. Height of ends, 60 inches; height of lower spring, 13 inches; height of upper spring, 52 inches; length, 76 inches. Sizes: 4-6, 4-0, 3-6, 3-0, 2-6. Shipping weight, 145 pounds.

Good sound sleep for your men will repay you many times over in increased vigor and work.

No chance for vermin in these steel frames. Can be erected or taken down in a few minutes. Packed flat for shipping. ***Last a lifetime.*** We guarantee every bed for 20 years. They are strong and much more comfortable than wooden bunks.

Mattress is strong, durable, light—filled with clean, curled wood fibre.

Special prices for lumbermen. Write us for further information.

If All Saw Gumming Wheels Were Aloxite Wheels

THERE would be better gummed saws—no case hardening, no drawing of the temper—just clean, fast, cool cutting without drag; without unnecessary heat. Aloxite Saw Gumming Wheels hold their shape and they show long life.

The proof of all this is in a trial wheel

ARE YOU PROUD OF YOUR HORSES?

Lumbermen have the best horses in the country. They take a keen pride in keeping them in tip-top condition.
Those horses should have the best harness.
For over 50 years we have been making a fine grade of harness for the Canadian trade. Our special strength Lumber Harness is the perfect outfit for your fine horses.

ALLIGATOR BRAND HARNESS

Alligator Brand Harness has many superior points, but costs no more than the ordinary kind.
Send for our big catalogue describing and illustrating the kind you are looking for.

Lamontagne Limited

Transmit 100% of Your Power

Why pay good money to generate power and then employ a poor belt that will only transmit a fraction of that power.

If you equip your mill with Goodhue Belts you can transmit 100% of the power generated.

Goodhue Belts stretch 15% to 25% less than other belts and have just the right amount of "cling" on the pulley.

Write us for particulars and prices

YOU CAN DO IT WITH A— GOODHUE BELT

Barienger Braking Device and Steeper Roads

THIS braking device for letting heavy loads down steep hills and mountain roads can effect a big saving in your logging operations. By the use of this brake it will be possible to construct hauling roads steeper and in consequence enough shorter to make a considerable saving in the cost of road building. Often the saving is enough to offset the cost of the brake.

The Barienger Braking Device is also a safe-guard for your horses and men.

48" Slasher

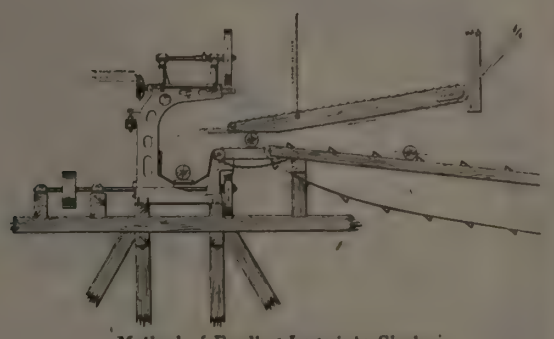
The Clark Band Saw Slasher for Cutting Pulpwood

Made for either 24" or 48" Wood

The Band Saw has 3/32" Kerf and Cuts SMOOTH.

Your saw has 3/8" to 1/2" Kerf and leaves end of wood torn and rough.

The Band Slasher takes only 1/3 as much power to drive as a Circular Saw Slasher.



Method of Feeding Logs into Slasher

Let us give you drawings and estimates for one to fit your plant

CLARK BROS CO., Olean, N. Y.

Garlock Packings

Are made in over two hundred styles and combinations to meet every known requirement. We will assume entire responsibility in selecting the proper styles and combinations of our packings to work successfully and economically under any stated condition; and if goods are not wholly satisfactory to purchaser we will refund promptly the cost of same. A card will bring our new catalog which fully describes our various styles of packings.

Style No. 777

Style No. 150

The Garlock Packing Co.

Hamilton, Ontario

Branches: Calgary, Montreal

Branches: Toronto, Winnipeg

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

EST. 1880 "FACTS FIRST"

James D. Lacey & Co.

EXPERIENCE : RESOURCES : PRECISION

Bankers Often Make a Loan Solely on a Lacey Report

Many bankers will hardly consider making a loan in the absence of a favorable LACEY REPORT. Having made unsatisfactory transactions on the basis of an ordinary "timber cruise" they are, not unnaturally, disposed thereafter to seek the nearest possible approach to scientific knowledge of the facts. This is to be found in a full LACEY REPORT.

While not all bankers are as yet sufficiently well versed in timber matters to appreciate fully the security offered them by the facilities of Lacey & Company, the possession of a full and favorable LACEY REPORT on your holdings will usually greatly enhance their value as a basis for financial transactions.

Of course there are several degrees of completeness of LACEY REPORTS determined by requirements and cost. Careful bankers, therefore, (like careful buyers and sellers) insist on the full LACEY REPORT. Very glad to send you our book of "Pointers." Write for it.

FIRE BRICK

On a Quality Basis

Use as much care in its selection as you would in choosing the lumber that goes into your products.

No brick gives the best results for every purpose. The brick you would use for your refuse burner may not give you the best results for your Dutch Oven.

We Manufacture the Following Well Known Brands

"Elkco," "Elk Steel," "St Marys," "Keystone" and "Rotex"

When sending us your inquiries, specify for what purpose you need the brick.

We Make a Specialty of

REFUSE BURNERS, BOILER SETTINGS, KILNS, DUTCH OVENS, ETC.

Catalog sent upon request.

1103 University Ave.
ROCHESTER, N. Y.

INDUSTRIAL LOCOMOTIVES

A locomotive to justify its cost must start the required load and keep it going.

The right amount of the right material must be provided in the right place.

Each and every part must be sure to fit not only the locomotive for which it was made, but every other locomotive of the same size and design. Spare parts must be instantly available, made so well as to go into place without a machine shop.

We have a number of standard sizes of locomotives in stock and can make immediate delivery.

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

CLIMAX Improved Geared LOCOMOTIVES FOR WOOD AND IRON RAILS

A 62-ton Climax Locomotive Designed Especially for Heavy Logging Work

Climax Locomotives are successfully operated on steep grades and sharp curves. Any weight or gauge. Locomotives in stock for immediate shipment. Get Catalog "H."

CLIMAX MANUFACTURING CO., 313 W. Main Street, CORRY, PA.
VANCOUVER MACHINERY DEPOT, LTD.. VANCOUVER, B.C.

Steam Log Kickers

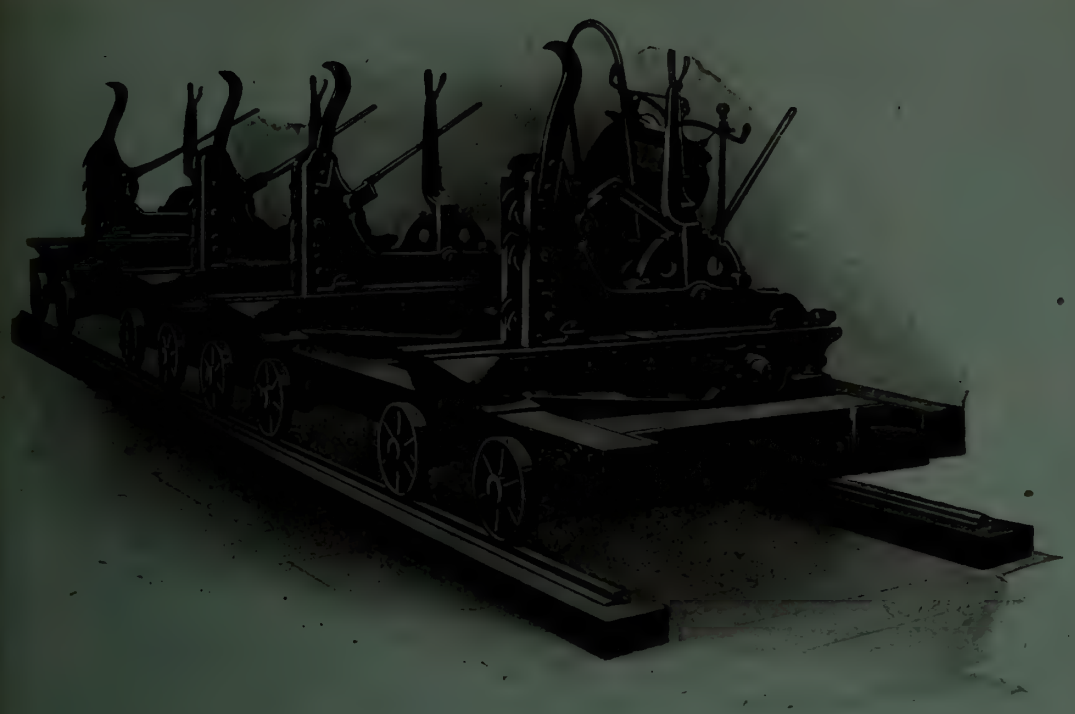
The illustration shows our Standard Double Deck Steam Log Kicker which we manufacture with cylinders 8 in., 10 in. and 12 in. bore. This kicker is made for either single or double deck mills. The bottom head of the cylinder is cast solid, eliminating the necessity of taking the machine apart for packing. The joint between the valve case and cylinder is a "ground joint" which is perfectly steam tight and requires no packing.

Catalogue on request.

The E. Long Mfg. Co., Limited

Orillia, Ont.

This mark on your saw mill machinery is an indication that your lumber manufacturing equipment is the best and most economical money can buy.



RACK CARRIAGES

Built with knee opening 36 in., 42 in., 50 in., 60 in. and 72 in.

Designed for rope or steam feed—supplied in any length and with any number of head blocks.

Frame of oak, iron-banded. Axles, knees, log seats, and operating racks and pinions of steel.

Knees extra high, fitted with nigger hook and 5-in. spring-cushioned taper movement.

Waterous Inserted Tooth Dogs or Waterous New Model Dogs are provided.

Set works combine setter and receder in one machine. Waterous Steam Setter or our rope-driven Trout Power Set Works can be supplied.

Waterous Carriages

Built in Every Size to Suit Every Size Mill

SCREW CARRIAGES

Built in sizes to open 60 in., 72 in. and 84 in.

Frame of oak,—logseats, knees, running gear, dogs, set works, etc., of steel.

Knees provided with Cant Hook and Spud Dogs and steel top roller.

Logseats have deep grip plugs on frame, are reinforced on top with reversible steel facing strips.

Waterous Steam Setter or Rope-driven Trout Power Set Works supplied.

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 30c per lb., Fort William and East; West of Fort William 35c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, 40c per lb.; West of Fort William, 45c, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

"LIDGERWOOD" PORTABLE HIGH SPAR SKIDDERS

OPERATING OVER

LONGEST SINGLE SPAN

IN THE WORLD

Skidding Logs over 3800 feet

"Lidgerwood" Cableway Skidders have two exclusive and patented features and these are essential to the success of this style of lumbering.

1.—"Lidgerwood" Cableway Skidders have a mechanical slack puller. The buggy is held stationary while the mechanical slack puller pays out all slack required in the skidding line to reach logs lying at a distance each side of skidder.

2.—"Lidgerwood" Cableway Skidders have a two speed device on the engine which returns the buggy to the woods at high speed.

We have paid special attention to the construction of Cableway Skidders required by conditions in British Columbia and the most successful machines now in use in that province were installed by us.

Not Only
WHITE ENAMEL
But
STAINED and VARNISHED FINISHES
As Well Can Be Successfully Carried Out On

ARKANSAS SOFT PINE

Being a practically non-resinous wood in the finish grades, it is not necessary to shellac the raw surface, but instead the chosen stain of whatever color is applied **FIRST,** insuring a perfectly uniform absorption. Shellacs and varnishes are then applied and rubbed down.

We urgently recommend machine sanding as against hand work on the bench. All finish should be so worked wherever possible. This treatment in combination with the above method of final application insures a beautiful satin-like surface to the completed work.

Arkansas Soft Pine is properly suitable for woodwork in fine residences, apartments, churches and offices. It is being **NATIONALLY ADVERTISED.** It is identified by a registered trade mark. Its manufacturers **STAND BEHIND IT.**

What better selling arguments could you put to your trade, Mr. Dealer? Better let us quote on your next car.

All stock bearing the Arkansas Soft Pine Trade Mark is manufactured and sold exclusively by the following companies:

Crossett Lumber Company, Crossett, Ark.
Eagle Lumber Company, Eagle Mills, Ark.
Edgar Lumber Company, Wesson, Ark.
Freeman-Smith Lumber Company, Millville, Ark.
Fordyce Lumber Company, Fordyce, Ark.
Gates Lumber Company, Wilmar, Ark.
Southern Lumber Company, Warren, Ark.
Stout Lumber Company, Thornton, Ark.
Valley Lumber Company, Reader, Ark.
Wisconsin & Arkansas Lumber Company, Malvern, Ark
Arkansas Land & Lumber Company, Malvern, Ark.
Arkansas Lumber Company, Warren, Ark.
Cotton Belt Lumber Company, Bearden, Ark.

To secure quotations with the least delay, price inquiries should be sent direct to any of the above companies. Literature, samples and information will be supplied promptly on request, by the

ARKANSAS SOFT PINE BUREAU

You are Never in Doubt when you Buy of Borbridge.

Patented 1911

No. 152 Long Leg Seamless Heel Draw String Moccasins

The latest improvement in Moccasins, doing away with all seams at heel. Under the old method the heel would come down, and in a short time the wearer would be walking on it, wearing out the stitching, thus causing it to leak and rip. With the new process the heel will not flatten out, will always keep its shape, and there are no seams whatever, making a clean smooth Ripless and Waterproof heel. Made only in the highest quality, all heights of leg, with or without soles or heels.

WRITE FOR CATALOGUE AND PRICE LIST.

You are never in doubt when you buy from Borbridge. We have been dealing with the lumbermen of Canada for upwards of a quarter century.

A Hubbard Oven In Your Camp

A number 3 Hubbard Oven, 31 square feet of tile baking surface, occupies floor space of 5 ft. x 5 ft. 6 in. Height over all, from 5 ft. 7 in. to 6 ft. 4 in. Shipping weight ***only*** 2,100 pounds. Also made in four other sizes.

The "Hubbard" portable baking oven equipped with "Perfect Rocker Grates" is a sanitary, economical and efficient baking device for lumber camp use. It is substantially built, compact in design, and consumes a surprisingly small amount of fuel.

Accompanying is a list of representative lumber camps using the "Hubbard" oven with perfect satisfaction

Every oven is carefully assembled in every detail before being shipped. This assures the purchaser that there will not be the slightest trouble in erecting the oven at its destination. No special tools are required, and every oven is shipped complete.

Write for prices f.o.b. your station.

KLIM

SPELL IT BACKWARD
PURE SEPARATED MILK
IN POWDER FORM
FOR ALL USES
WHERE MILK IS NEEDED

The Canadian Government

knows all about Klim and, therefore, uses it exclusively in all soldiers' camps. Many lumber companies know about Klim and they all insist on having it. Here are six reasons—

Why You Should Use It

Klim is in dry powder form.
Klim is not affected by heat or cold.
Klim is cheaper than fresh liquid milk.
Klim is about half the price of Condensed Milk.
Klim is about a third the weight of Condensed Milk.
Klim has the flavor of fresh liquid milk.

Your Men Will Like It

Does this not prove to you that you should use KLIM the Lumberman's Milk.

Packed in ten pound tins, six in a case, costing $10.20 per case.

A pound makes a gallon.

Your Wholesale Grocer has it.

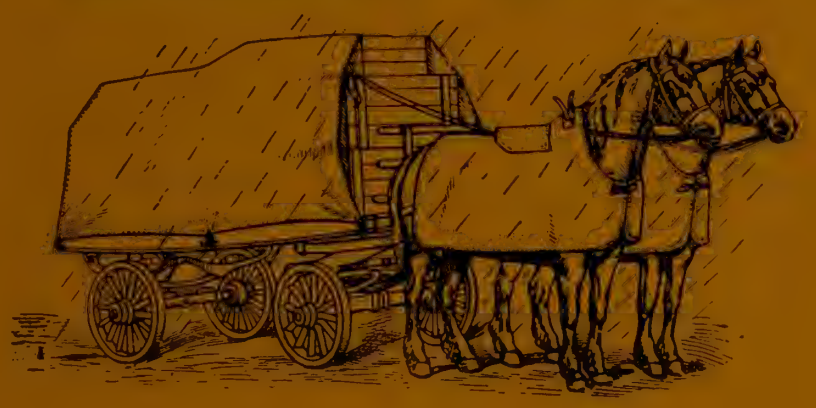
Smart-Woods LIMITED CANADA

Tents, Horse Blankets

Tents are our chief product. We make a specialty of Tents for every purpose. Wherever Tents are mentioned in any part of Canada "Smart-Woods" immediately comes to mind. For lumbermen we have a particularly fine line of strongly made tents for stable use and also well planned camp tents for from two to eight men. A number of these are kept in stock at all times for rush shipments. We can make up any size or style at short notice from our own "Woods' Non-absorbent Duck." This duck is the finest for Tent use we have been able to find and it is used exclusively in Smart-Woods Tents.

Merchandise and Wagon Covers



We shall be glad to send you particulars and prices of any style of tent.

Lumbermen Should Not Neglect their Horses or Merchandise

Make sure you are well supplied with warm waterproof covers and blankets. We have large stocks of blankets and merchandise covers in proper shapes and full sizes. Let us quote prices and send you samples.

The lines we mention in these pages are by no means our complete list of equipment for lumbermen. We have an illustrated catalogue (84 pages) filled with interesting matter for you. Let us send you a copy to-day.

Where Our Products Are Manufactured

Smart-Woods' Winnipeg Factory No. 1

Montreal Factory No. 2

Toronto Factory

Winnipeg Factory No. 2

TO give you an idea of the manufacturing facilities behind our organization we reproduce illustrations of several of our model factories.

The Smart-Woods Company for many years has supplied lumbermen, sportsmen, etc., with a superior quality of equipment. Our reputation for fair dealing and honest merchandising has travelled from coast to coast.

The result has been a tremendously increased demand from every quarter for products of the Smart-Woods organization. Our manufacturing facilities have been increased more than four-fold in the past few years.

Customers reap the benefits of larger production. We are enenabled to manufacture to better advantage and our distribution facilities have been brought to a point of lowest possible cost.

Send for our catalogue and note the prices made possible for you through our modern merchandising methods.

Smart-Woods LIMITED CANADA

How We Give Larger Values To Our Customers

INCREASED production means lower individual costs when production is efficiently managed.

That was the idea upon which we worked when our many plants were organized under one managing head. Results have amply proved our contentions.

Never before have we produced better quality in all our many lines of equipment for lumbermen, etc. In the face of rising costs, which are staggering the majority of organizations, we have brought out our 1916 line at prices as low as last year.

Lumbermen are quick to appreciate better values in their buying. We have the greatest assurance from business already consumated that the present season will outstrip anything we have done heretofore.

We feel this business has resulted first, from our reputation for quality and fair dealing, and second, from our exceptional values as a direct result of our present production methods.

We shall be glad to hear from you in reference to any equipment you need.

Lumbermen's Supplies

Mackinaw Jumpers

Our Mackinaw Jumpers, as illustrated, are the finest for lumbermen. Take the place of rolled neck sweater and are more serviceable. Light and warm, button close up around neck, and are far superior to coat or sweater.

Socks, Mitts, Gloves

We make a very serviceable grade of Long Stockings in Worsted and All Wool. Any weight and in Black or fancy. Our special socks are made in our own factory and are strictly all wool. Our Mule Skin Gloves with cord fastener are made in large and full fitting sizes. Also made in Wetproof Horsehide and Calfskin. A complete line of mitts in wool, etc., for the lumber trade.

Mackinaw Coats

We have a complete line of Mackinaws suitable for lumbermen. Made in Norfolk style, with shawl and tab collars. 35 inches long and well tailored throughout. Made in Brown, Black Check, Red and Black Check, and several plain colors. Sizes 36 to 46. We also make regular Hunting Style Coats in Drill, Corduroy, and Bedford Cord.

Shoe Packs, Moccasins

Our own make of Horsehide Moccasins and Drawstring Shoe Packs are the very highest grade that can possibly be manufactured. Every pair guaranteed waterproof and rip-proof. We will replace any pair free of charge that do not prove satisfactory. Supplied in any size or length and in light and heavy weight leathers.

Underwear

Our line of men's underwear is knit to our special order. We can supply you with any style or weight of garment desired in ribbed or flat knit. In these lines we have introduced special features that can be secured only through our company. Our ever-increasing business in underwear is an indication that our new ideas are popular.

Knickers, Breeches

Men's Mackinaw (Bird's Pure Wool) Knickers can be supplied in Black shades only. They have top and hip pockets. Strap or wool cuff. Convenient and comfortable. These are made also in heavy tweed. We make perfect fitting Riding Breeches from Drill, Corduroy, Bedford Cord, Black and Fancy Mackinaws and Moleskin.

Mill Construction Buildings

British Columbia Douglas Fir in a Mill Construction Building Being Erected in Toronto

MILL CONSTRUCTION FOR 100 YEARS HAS BEEN A STANDARD TYPE OF BUILDING FOR FACTORIES, MILLS, WAREHOUSES, AND STORES. IT IS DESERVING OF CAREFUL CONSIDERATION BY EVERY PROSPECTIVE BUILDER OF SUCH STRUCTURES. THE ADVANTAGES OF THE MILL CONSTRUCTION TYPE OF BUILDING ARE:—

1. A saving of from 10 to 35 per cent. in initial cost.
2. Reduction in insurance rates. (With sprinkler system the rate on mill construction buildings is less than that for fireproof types of buildings unsprinklered, and but slightly greater than the rate for sprinklered fireproof buildings.)
3. Permits alterations and additions to be easily and cheaply made.
4. It is specially adapted for structures for temporary use. Where the future development of any portion of a city cannot be accurately forecasted, making the selection of a type of building for permanent use difficult, the adoption of the mill construction type is indicated. Also where it is necessary to obtain an immediate revenue and conditions do not justify the erection of a permanent structure, the mill construction building will best answer the purpose.
5. Sanitary and healthful.
6. Saving of time. Of all types of buildings the mill construction type is the most speedily erected.

British Columbia Douglas Fir the Best Wood for Heavy Timber Mill Construction

British Columbia Douglas Fir is the strongest wood in the world available in abundance and in all sizes, for posts, beams, girders, and slab floors. It increases in strength with seasoning to a remarkable degree. It is very free from sap, does not twist, and is easy to work.

The superiority of British Columbia Douglas Fir over other woods for mill construction is recognized by the leading engineers and architects throughout Canada. British Columbia Douglas Fir is obtainable in every part of Canada at favorable prices.

For further information regarding British Columbia woods for use in mill construction buildings address the B. C. LUMBER COMMISSIONER, EXCELSIOR LIFE BUILDING, TORONTO, or the Chief Forester, Victoria, B.C.

British Columbia Has a Wood For Every Use

Nutritious Camp Food

TO get the best out of your men feed them wholesome, nutritious food. In the various products of our mills you will find the highest quality prevails. The following lines are excellent for camp use:—

Tillson's Rolled Oats

SUPPLIES

TO you who are about ready to put in Camp Supplies, we have a special message—to tell you that we purchase in a very large way and are at all times able to make offerings of anything in the grocery line at attractive prices, and owing to our new and modern equipment are in a splendid position to render good service in connection with any orders for goods with which you may favor us. Our business is large enough to be run on a department plan and in consequence we are able to specialize in all the leading lines. We have Coffee, Tea, Canned Goods, and Dried Fruit departments, all of which are controlled by men who are skilled in their work and are experts in their particular line.

Our coffee plant is equipped with the latest and most improved machinery that is known to the trade, and we are able to produce as fine an article as is possible. In Teas we are very large handlers and buying and selling in big blocks we are enabled to pick up kinds which are particularly suited for the camp—good strong cup quality with some flavor and at a moderate price.

In Canned Goods we are recognized as perhaps the heaviest dealers in the Dominion and always have some attractive trades. You, who are not already dealing with us, get in touch now—perhaps we can save you some money and also give you some satisfaction.

National Oats

An unbroken chain of careful supervision marks the progress of NATIONAL OATS from the field of the grower to the finished shipment in sacks direct to you.

Hundreds and hundreds of acres of the choicest grain is sent to us annually, to be handled by OUR MORE THAN SEVENTY ELEVATORS in the very best oat-growing sections of Western Canada.

From Field to You

National Oats—the nationally accepted standard of fine grain, purity, and cleanliness. Lumbermen all over Canada are ordering their winter supplies of National Oats right now. Quality has brought the reputation of our product to the point where the lumbermen who know naturally expect NATIONAL OATS when they order the best.

We make it a special point to use heavy, strong. well-sewn bags in our sacked shipments, in anticipation of the rough handling incident to camp use.

Send for prices to-day, while you can make sure of your shipments.

"Moose Head Brand" Oil Tanned Shoe Packs and Moccasins

Over 40 years ago we started manufacturing the "Moose Head Brand" lines. We were the first in this country to produce Shoe Packs. Our supremacy in this field has never been questioned.

Our range of Draw String non-rip Shoe Packs from 6 in. to 17 in. lengths is most complete.

Quality marks the manufacture of our footwear from start to finish. We select only first grade packers steer hides. Our waterproof oil tannage is the best in the world. For wear, comfort, and waterproof qualities they are unequaled.

If your supply house does not carry our lines write or wire us direct, and we will see that you are supplied. Orders filled promptly.

Let us send you our 1916 catalogue. We have sizes and styles to suit every lumberman.

The Parkhill Double-Deck Wooden Bunk Bed

Just What Every Lumber Camp Needs

Sound sleep makes the men contented and contentment means better work every time. Sound sleep gives your men the health and vigor to accomplish better work the following day.

Give your men clean comfortable bunks and they will appreciate your thoughtfulness.

This wooden bunk is vermin-proof and sanitary at all times, because there are no grooves anywhere in the frame to harbor vermin—every piece is finished smooth and flush.

Plenty of room in the lower bunk, and the upper one is low enough to get in and out of conveniently.

The Parkhill Twisted Link Fabric Springs suspended with oil-tempered helicals give a maximum of comfort and strength.

Frame is of hardwood, and the whole is so constructed that the bunk is absolutely rigid, and capable of standing any shock or strain. ***Ask us for further information—to-day.***

Complete Your Lumber Accounting
"Swift as Lightning!"

The marvelous simplicity of the Dalton, the almost human intelligence displayed by this wonderful ten-key adding and calculating machine in working the most intricate problems in multiplication and division that occur daily in the lumber business, is a revelation to those familiar only with the ordinary adding machine.

The Dalton automatically places the figures in the proper columns, and gives a printed record of the calculation. On account of the extreme simplicity of operation, it is not merely the fastest adding and listing machine on the market, but is also the most versatile, as it performs any calculation required in the lumber business.

Tell us what kind of calculations you have and we shall show you how easily the Dalton handles them.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.
Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 **Toronto, September 1, 1916** **No. 17**

The Logging Outlook for 1916-1917

The approach of the logging season of 1916-17 finds the lumber manufacturers of Canada face to face with a series of problems such as they never had to deal with before, and for which there is little or nothing in the way of definite material upon which to base their decisions regarding the extent of woods operations that will be advisable.

Never before have the operators experienced such a uniform series of adverse conditions relating to logging operations as those with which they are confronted today. These conditions can be summed up briefly. In the matter of expense alone there is much good reason for a reduction of woods operations next winter. Labor has gone up rapidly in cost and has reached figures that have never before been dreamed of, while at the same time, the efficiency of such labor as is available is far below what it has ever been before; so that a simple comparison of wages does not tell the whole story. A comparison of outlay for labor, with log production, will show an astonishing state of affairs during the coming winter, if conditions continue as they are today, and no one at present can see the slightest indication of improvement in this respect.

The cause of the increased cost of labor is understood by everyone. It is scarcity of men, resulting from the great numbers who have gone to the front, or have found better pay in the production of munitions and other materials for which the war has created an urgent demand. This being the case, the inclination of all lumbermen is to take the matter philosophically and to say to themselves that the business of the war must have first place.

For reasons of a similar nature the cost of food and equipment for lumber camps has also soared, until today food stuffs alone are costing the camps from 25 per cent. all the way to 100 per cent. and even more, in excess of the cost in the days before the war; and again, it is a case of looking upon the bright side of things as far as possible and considering that the high cost is, in a measure, helping us to win the war, by maintaining steady employment for those who remain at home.

Then there is the market situation to consider. Like the other elements of the case, this is more or less of a mystery, so far as its future course is concerned. No one has any uncertainty about actual conditions prevailing today. In connection with nearly all markets, trade is abnormally quiet. Home consumption has been reduced to a minimum. Export trade has been spasmodic, especially the export trade with the United States. Periods of considerable activity have been common of late months in the demand from the United States, and following closely upon them have come periods of idleness, which indicate that such activity as the United States is enjoying today is very closely regulated by the volume of orders received, or in sight, for the production of war materials for the Allies.

The export trade with Great Britain has also been spotty, but on the whole characterized by a good demand for anything that can be delivered; but delivery has been the fly in the ointment, as everyone knows. Many an exporter has looked across the Atlantic, figuratively speaking, and felt that the English market resembled a fine fruit tree standing on the other side of a very high wall.

So we do not know what the future has in store for us in any direction, and the cue for all seems to be to act as nearly as our means will permit in a cautious and normal manner, so that we may be prepared to strike a happy mean, and be in shape to make the best of whatever industrial and trade conditions develop.

It is a time for considering our business activities in the light, not only of their effect upon our own bank accounts, but, so far as possible in the light of their effect upon our whole national well-being. Manufacturers who are financially able to do so, will be justified in operating to a fair extent for the sake of assisting in keeping the wheels of industry turning; and with such conditions as we have today there is no reason to fear that those who do so will be the losers thereby, for unquestionably the output during the coming winter will be curtailed to such an extent that available supplies next year will not be too heavy for the markets.

In the present issue of the Canada Lumberman we publish the views of a number of lumbermen upon this situation, and we have gathered together also an interesting variety of descriptive and practical articles about the logging industry, which will give our readers a good conception of its greatness and variety, and will show them, we believe, that even this time-honored industry in which methods have long ago reached a considerable degree of standardization, is continually developing new lines that result in important progress.

The Reader's Viewpoint on Current Topics

Shortage of Labor Creating Critical Production Situation

In the following letters we publish the opinions of a number of well-known operators in regard to the present labor situation. The interference with shipments which has already resulted from labor shortage and the curtailment of output which is likely to develop during next winter, are matters of great concern to everyone connected with the industry. There is such unanimity of opinion upon these points that, by presenting the views of a few prominent operators we feel we are giving everyone in the industry a fairly complete and quite reliable review of the situation which will enable them to regulate their own operations more intelligently than would be otherwise possible. We would be glad to have other letters upon this subject, especially from operators who have anything valuable in the way of suggestions to make as to the best course to pursue during the coming winter.

Wages Increased by Eighty Per Cent.

Editor Canada Lumberman:

Labor and supplies for logging operations are this year much more expensive than in former years. We find the comparisons work out about as follows:—

	1916-17 wages	1915-16 wages
Road cutters	$30 to $33	$16 to $20
General hands	34 to 37	20 to 22
Log makers and teamsters	37 to 40	24 to 26
Average	38	21
Advance	80 per cent.	

The cost of supplies this year is extremely high. Pork, beef, sugar and flour have all advanced about 100 per cent. above the prices prevailing before the war.

Labor, even at its higher cost, is restless, and men are hard to get who will stay steadily at work. We feel, therefore, that the cost of logging will be practically double what it was a year ago, and unless the price of lumber advances in proportion (which it has shown no signs of doing so far) the lumbermen must face a heavy loss if they take out logs this winter.

No building operations of any kind are in sight. The only markets of any consequence seem to be in the manufacturing lines and in box making.

Pulp and paper mills seem to be getting advances in box price of their finished product, corresponding with the increased cost, and so they can pay these higher rates, but up to date, no considerable advance has occurred in the price of lumber. The writer cannot see any encouraging prospect of such an advance becoming effective, so as to equal the increased cost.—Manufacturer.

* * *

Everything Going Up

Editor Canada Lumberman: Three Rivers, P.Q.

The labor situation is certainly serious. Men are very hard to get and when you have them you are sot sure of keeping them a day. Quite a number of young men from our mill have gone west for the harvesting, and then contractors that are putting up some buildings are paying all sorts of wages, so that it makes the men unsteady, and they jump from one place to another. I was telling a party the other day it was lucky the schools were not open or we would have to shut down as lots of the bigger boys are working.

Regarding winter operations it is hard to say at present what the situation will be. It looks as if it was going to be hard to get all the labor wanted, but, of course, all mills and most of the contractors will be shut down, which will give a few.

Supplies are high, which is likely to make the cost of getting out logs higher.—The Burrill Lumber Company.

* * *

St. John Not Actually Affected by Labor Shortage

Editor Canada Lumberman: St. John, N.B.

So far as St. John is concerned we have not felt the labor situation very acutely. There has been sufficient labor for our mill and factory during the entire summer, and we do not anticipate any shortage until the winter season starts in, when, as you know, the mills cease operation in this section of the country. At the present moment a number of the mills are idle, on account of the prices in the American market being so poor. Also, within the next few weeks several other mills will cease operations for the want of logs.

As to our mills in Quebec, they are somewhat off the line of the railway, in a brand new country, and labor, while plentiful, is not of the right kind. As to what the winter will bring forth for the seeds at our camps we cannot say. Operating costs are steadily advancing both on account of the quality of the labor and price of supplies. It looks very much as if logs would cost considerably more next winter than they have in late years. Of course, this all depends upon the situation when the war is over.—Murray and Gregory, Ltd.

* * *

Higher Lumber Prices Required to Justify Logging

Editor Canada Lumberman: Bathurst, N.B.

The labor situation in this district is a very serious one at the present time, owing to the shortage of men and the high wages. We find that not only do we have to pay more money, but we get very much less efficient service. We always find this to be the case, that the more you pay men the less service you get from them. The trouble today is that there are probably at least two jobs for every available man, and this makes for their independence. Wages have gone up here fully 25 per cent. above normal and we cannot get enough men to operate our mills and look after our shipping. This work is very seriously handicapped.

Regarding men going into the woods, up to the present we have been unable to start any camps owing to the fact that the men's ideas of wages are so extravagant that we do not feel it safe to put them in. We are simply waiting to see what will turn up, and we are hoping that when the harvest is reaped men will be somewhat more plentiful and more reasonable in their demands. The trouble is that the lumber business cannot stand the increased cost of raw materials and wages that we would have to spend this year if we were going to get out a new crop of logs. Unless there is a decided improvement in the value of lumber the lumbermen might as well lie back and do nothing this winter, as we see little prospect of getting costs back when we come to sell the manufactured article. We certainly should get an advance of 20 to 25 per cent. next year if the present conditions as to cost prevail throughout the winter, and we see very little prospect of their being lowered very materially.—Bathurst Lumber Company, Limited.

* * *

Logging Will Cost Three to Four Dollars a Thousand More

Editor Canada Lumberman: Blind River, Ont.

The labor situation is a problem in this part of the country. We find it very difficult to keep sufficient men to keep our mill running, and, so far as the woods operations are concerned, we do not intend to do over one-half of what we did last year. For instance, we ran six camps last winter, and I doubt whether we will run three this year. We find labor very scarce and unsteady and know that it will be very hard to get woodsmen.

Wages started off here at $26 to $35 per month, but I understand now that they are up to $30 to $40 per month and the men are still looking for more. Just where the wages will get to remains to be seen.

I understand that there are some lumbermen throughout the country who have had fires through their limits, who are really forced to go in and operate. Again, the pulp people are getting enormous prices for their pulp and they are after a full stock. The lumber prices do not warrant the lumbermen making this extra effort. Any well informed lumberman understands, if he intends to operate this year, that there will be an additional cost above operating last year of from $3 to $4 per thousand feet, and unless they can see a better lumber market coming, there is not very much inducement for him to go in. However, the companies that have plants and are organized, hate to stop and break up, as it means practically a new organization when they start again, and I presume some of them will keep going in a somewhat curtailed manner.—John R. Stover.

* * *

Will Operate on a Small Scale Only

Editor Canada Lumberman: Haileybury, Ont.

We are not figuring on doing very much this season until the first of November or thereabouts. Labor is going to be very scarce, or in other words, to get the labor high wages will have to be paid, higher than the lumber trade can afford, along with the high cost of necessities, provisions, etc. We have not felt the labor shortage so much until recently, when farm labor became in such demand. We are not preparing to do any definite amount of operating other than just go along with the conditions as they exist.—Conkey & Murphy.

* * *

Labor Scarce but the War Comes First

Editor Canada Lumberman: Waubaushene, Ont.

The labor situation here, I presume, is the same as at many other places, possibly a little more acute, as so many of our able-bodied men, both married and single, have enlisted. We are short of men and only able to run part of our mill. However, we are doing the best we can under existing conditions. We consider the war has first claim,—a successful ending is what is required.

We cannot say at the present time what condition will exist in the camps

this winter, as we have not commenced operating yet, but from present appearances we think there will be a shortage of men, and inferior workmen offering. This, together with the high price of supplies and all other material used by lumbermen, makes the future for those engaged in the lumber trade not very bright. The result must be higher prices next year for lumber, or those in the trade will have to go out of business.—W. J. Sheppard.

* * *

Expect High Costs Till End of War

Editor Canada Lumberman: Fassett, Que.

The labor situation is as bad here as we have ever seen it. We are experiencing trouble at our plant, as well as in the woods, and at the present time are short of men for grading the railroad. This work is usually done by foreigners, but it seems impossible to get them at this time. We contemplate cutting our usual amount this season, and while we expect to be more or less handicapped for want of labor to cut logs, we think that by the fall, we will be able to secure a fair number of men.

We find that wages have increased all around about two per cent. Supplies have also increased in price, but to what percentage, we are not in a position to advise.

We do not look for conditions to better so long as the war lasts.—Fassett Lumber Company, Limited.

* * *

Getting the Men but Paying Higher Wages

Editor Canada Lumberman: Toronto, Ont.

While we had for a short time some difficulty in obtaining men for our preparatory bush work, nevertheless, we have secured all the men that we require. During the past two weeks, we could have secured a large gang of men for bush work for our log operatioss had we required them, but inasmuch as we have not decided the question as to operations, we cannot very well advise as to the labor conditions as respects our operations.

Wages are, of course, much higher than in other years, and the price of supplies, principally pork, has advanced very materially. We consider that the lumbermen should increase the price to compensate for the increased cost of operations.

Ae regards the sawmill operations, we have not had any great difficulty in obtaining our requisite number of men. Wages have been increased proportionately with other labor.—Standard Chemical Iron and Lumber Co.

* * *

Everything Going Up But Lumber

Editor Canada Lumberman: Louiseville, Que.

It is early for us to say what the labor situation will be for next season's logging operations, but, so far as we can judge, labor will be scarce and wages high. As for our milling operations here, we had to raise the wages of our men about 10 per cent. only lately, on account of the high cost of living, as laborers find it very difficult to live with normal wages, everything being so dear.

We shall probably have to reduce the cut of our logs next winter on account of the scarcity of labor and also on account of high wages, and it is our belief that it will be quite a problem to cut the usual quantity of logs.

Everything manufactured has advanced in price. About the only manufactured goods that have not gone up, and in fact in some cases have gone down, is lumber, and, of course, if cost of labor keeps on advancing and price of lumber decreasing, production will be reduced. The same cannot be said of pulpwood, as it is in great demand and paper manufacturers are making good profits.—The Tourville Lumber Mills Company.

* * *

Throwing Away Stumpage

Editor Canada Lumberman: Blind River, Ont.

This is the worst fall I ever experienced in Canada, so far as the scarcity of labor is concerned. The men have all gone away to the front and I don't know what we can do. Last year we employed 600 men, paying them from $15 to $26 a month. This year we have cut down to 175 men and wages are running from $30 to $40 per month. The higher the wages are the less the results we secure from the labor. Every lumberman is cutting down around this vicinity. We have only started one camp yet and cannot get any men, but think that later on after the harvest, and when the mills have closed down, there will be more men available.

Our operating costs will be double this year. With the high cost of supplies and labor we will operate at a loss and throw away our stumpage.—J. H. Macdonald Lumber Company.

* * *

Labor Cost Increasing Production Cost

Editor Canada Lumberman: Penetanguishene, Ont.

The labor situation is indeed serious. For a while we had absolutely no shipping gang, and did not make any shipments for two weeks or more. We are getting very far behind with our orders. The labor, also, is not expert, and the increased cost of wages is driving up the cost of production. What the percentage is we are not able to determine, as it is spread over our season's operation.

At this writing we expect to do very little in the camps this year unless we are forced to go in, as there is every possibility of loading oneself up with a lot of logs at high cost with the probability of not being able to realize more than you are putting into them.—The C. Beck Mfg. Company, Limited.

* * *

May Reduce Cut by One-third

Editor Canada Lumberman: Lyster, Que.

We are experiencing a shortage of labor, both at our mills and in our camps. We are approximately 25 per cent. under-manned.

All of our work in this section is done by jobbing, and the price so far has increased 25 per cent. over previous years' operations.—The Lotbiniere Lumber Company.

* * *

Mill Wages Higher than Ever Before

Editor Canada Lumberman: Midland, Ont.

As yet, it is too early to give you the information asked for about our bush operations, as we have only recently sent our superintendent up to make a start. We anticipate, however, that labor will be scarcer than last year and wages higher, although this may be remedied to a certain extent as a result of some lumbermen not operating to the extent they did last year.

As far as our mill work is concerned we find a decided scarcity of labor with a result that wages have gone substantially higher than we have ever paid before with no prospects for any improvement for the balance of the season.—Chew Bros.

* * *

Supplies Costing Much in Excess of Normal

Editor Canada Lumberman: Ottawa, Ont.

There is so doubt that there is a shortage of labor for the lumber business, but I am hopeful that with the conclusion of the harvest these conditions will become less acute.

With regard to the prices of supplies for the bush operations, it is, of course, well known that the present prices are far in excess of normal, and the cost of the bush operations this coming winter will, therefore, be considerably higher than in previous years. This advanced cost will also be affected by the higher rate of wages now prevailing.—J. R. Booth.

* * *

Operating Costs 35 Per Cent. Higher

Editor Canada Lumberman: Burks Falls, Ont.

The labor situation is affecting us very seriously, both at the mill and at any work in the country we have undertaken. There is a very great shortage of labor and, in addition to that, wages are very high and the men extremely indifferent and exacting. These facts, together with the price of supplies and the general difficulties of the situation, we believe, have increased operating costs about 35 per cent, as compared with last year.—The Knight Bros. Company, Limited.

* * *

Operating Costing Twenty Per Cent. More

Editor Canada Lumberman: Riviere Trois Pistoles, P.Q.

The labor situation is getting very critical and good men are getting scarce for mill and bush work. Wages are too high. Men work less time and live the same, owing to increase of wages. Prospects for men for next winter's operations are not very bright. The increase of cost with us, in productios, owing to increase of wages, material and provisions, and depreciation in quality of men, is about twenty per cent. compared with previous years before the war.—Trois Pistoles Pulp & Lumber Company.

* * *

Logging to be Very Expensive

Editor Canada Lumberman: New Richmond, Que.

We have not experienced any trouble with our mill crew, nor do we expect to have any shortage during the balance of the sawing season. We are opening up our camps this month, but it is very difficult to secure crews. Wages will be 15 to 20 per cent, higher than last year, and the men will not be up to the average, as a large proportion will be inexperienced youths, which, added to the high cost of supplies, will make very expensive logging.—Montgomery & Sons Company, Limited.

* * *

Lumber Prices Must Go Higher

Editor Canada Lumberman; East Angus, Que.

We have not yet got started to any great extent, but so far as we can judge at the present time, the extra cost of labor and supplies will bring our operating costs for next year over and above last year at least 25 per cent. Owing to this enormous increase in the cost of getting the lumber from the woods, it is very evident that the manufacturers will have to get a much better price for their lumber next year.—Brompton Pulp & Paper Company.

* * *

Operations Costing Fully 25 per cent. More

Editor Canada Lumberman; Otter Lake Station

We are finding the labor situation a very difficult problem, but so far, we have been able to cope with it. We are contemplating starting two camps in the near future and evidently they will be started very short handed, but we are living in hopes that the situation may improve when the cold weather sets in. The cost of operation this season is fully 25 per cent. in advance of last year.—Hocken Lumber Company, Limited.

A Waney Timber Operation in Ontario

Detailed Description of a Camp, Its Construction, Output, Management, Costs and Other Features

IT is so many years since the production of square and waney timber was the chief activity in the logging camps of eastern Canada that nowadays it is a difficult matter to obtain skilled workmen for the operation of a camp of this class. A few years ago, however, quite an extensive operation for the production of waney timber was carried on by J. J. McFadden on the Jocko limits in northern Ontario. These limits are located in the district of Nipissing, just east of the townships of Lockhart and Garrow, and they comprise an area of 25 square miles each, 50 square miles in all. At that time the operation was commenced, it was necessary, in order to reach the camp from Jocko Station, on the T. & N. O. Railway, about 32 miles north of North Bay, to travel a cadge road running east for ten miles to a camp of the Hawkesbury Lumber Company, and to continue thence four miles further in the same direction to the McFadden camp. During this first winter's operation the product was drawn from the camp by sleigh, a distance of six miles, to a siding, whence it was transported by rail to Quebec. For the information contained in the following article we are indebted to an interesting logging report prepared by Messrs. F. McVickar and R. M. Watt, as a part of their studies at the Forestry Department of the University of Toronto.

The class of labor employed in the manufacture of square and waney timber comprises men who are specially skilled in their particular lines. With the decline of the square timber industry, the opportunities for young men to learn the hewer's art became scanty. Naturally, therefore, the men now available are all old-timers and receive high wages, both on account of their skill and because of their willingness and general dependability.

The method of procedure in the production of square and waney timber is entirely different from any other logging operation. To some extent the organization and handling of the crew resembles that of an ordinary logging operation, but there are many important differences. The agent, or walking boss, in the first place makes his selection of a foreman and the two of them proceed to hire their crew. In this particular case the crew was assembled at North Bay, and brought to Jocko Station by rail. Arrived at the station, they were put to work first of all upon building a cadge road. In this case the main cadge road had only to be constructed from the Hawkesbury camp into the limits, a distance of about four miles. As soon as possible, the crew were put to work upon the building of the camp.

Mr. McFadden's plan in connection with this operation was to take out all the waney stuff during the first winter and subsequently to remove the spruce and pine saw logs. Economic considerations dictated his course in not carrying on the two operations at the same time. Had the two operations been carried on simultaneously it would have been necessary to have built a double sized camp and to have employed double the number of men and double the number of teams. This would have necessitated a much greater outlay of capital for camp construction and pay roll, as well as for maintenance. All this capital would have to be invested before any returns came in. Consequently, none of the profits of one operation could have been used to finance the other. Moreover, if a larger and costlier camp had been constructed the loggers would not have been able to operate over any larger territory than from a small and less expensive camp.

The Logging Camp Crew

The average number of men in the camp in connection with this operation was about 110. This number varied naturally from week to week, a few men always deciding to "hist their turkeys" and strike out for other camps, and delay being involved in finding others to fill the vacancies. The camp crew was divided as follows:—

	Per Month
Executive force:	
Agent and foreman;	
Subordinate executives:	
Buck beaver ... . at	$50
Cook ... ... at	75
Clerical:	
Clerk ... ... at	35
Government Inspection:	
Scaler ... ... at	100
Subordinate Labor:	
Cookees ... ... at	30
Bull cooks ... . at	$25
Fallers ... ... at	45
Liners ... ... at	50
Scorers ... ... at	40
Road monkeys and general hands ... . at	28 to 35
Swampers ... . at	30
Teamsters ... . at	40
Hewers	55 to 70
Blacksmith ... . at	60
Filer ... ... at	45

The crew was made up of French, Irish and Scotch, the great majority being French-Canadians. There were also a few Poles who were employed as road cutters, a class of work for which they are particularly well fitted, because of their great physical strength and their amenability to discipline, such as is administered at the hands of an Irish foreman.

Camp Layout and Construction

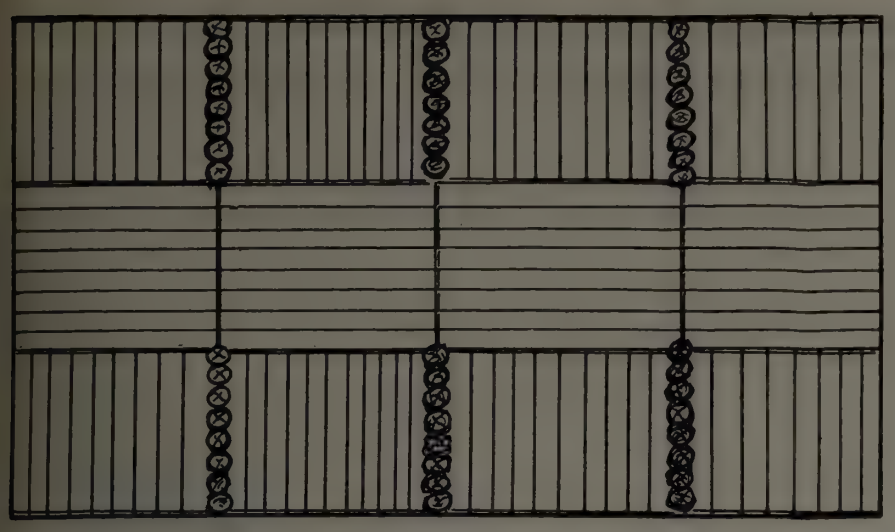
The laying out of a lumber camp is always associated with its individual problems connected with each new timber area that is to be logged. The camp at Jocko, consisting of 12 log buildings, covering an area of about one acre, was situated on a terrace above a slough. This location was chosen because it was the most central point for the waney timber, and also because of its proximity to a good water supply. The buildings were of the usual type found in the woods of northern Ontario, being constructed of logs, pine, spruce or fir, notched at the ends, and 8 to 10 logs high, the cracks being filled with moss or plaster. In most cases the logs were peeled before being used for camp construction, because this gives a cleaner log and less liable to attack from insects. The roofs and gable ends were covered with tar paper, which it is necessary to renew annually. The single exception in this regard was the cook house, which was covered with a prepared roofing. During construction, a crew of 25 men and four teams were employed for three weeks at a cost of from $1,500 to $2,000. The buildings put up were as follows:—Office, 18 feet x 24 feet; private camp, 16 feet x 22 feet; cook house, 28 feet x 50 feet; store house, 16 feet x 20 feet; two bunk houses, 68 feet by 44 feet; two stables, 36 feet x 28 feet; blacksmith shop, 18 feet x 24 feet; store house, 18 feet x 24 feet; filer's shack, 8 feet x 10 feet; and lavatory, 6 feet x 8 feet.

The Cook House: This building is exceptionally well ventilated and lighted, the kitchen occupying a space 16 ft. by 28 ft., while the remainder of the building is used for a dining hall, the men being served at three long tables.

The cook and his two helpers were well supplied with the necessary cooking utensils for the sanitary and economic preparation of food, these, with the other dishes required for serving could

Drawing Waney Timber into the Yard

End View of a Waney Skidway



Ground Plan of Stables

be replaced for $200. The management evidently believed in the old adage that the way to a man's heart is through his stomach, and by the careful selection of proper food and a good cook they increased the working efficiency of their men.

List of provisions required for a crew of 115 men for one week.

Meats:			Currants	lbs.	25
Beef	lbs.	1050	Condiments:		
Pork	"	175	Allspice	"	½
Bacon	"	150	Cinnamon	"	½
Fats:			Mustard	"	2
Butter	"	100	Ginger	"	2
Lard	"	100	Nutmeg	"	¼
Vegetables:			Pepper	"	1
Potatoes	"	750	Miscellaneous:		
Turnips	"	300	Cheese	"	50
Carrots	"	150	Flour	"	750
Beets	"	100	Baking Powder	"	9
Onions	"	40	Syrup	gals.	2
Peas	"	10	Pickles	pail	1
Beans	"	50	Vinegar	gal.	1
Cereals:			Corn starch	boxes	4
Oatmeal	"	10	Soda Biscuits	lbs.	30
Rice	"	15	Sugar, Cooking	"	200
Barley	"	10	Sugar, Table	"	100
Fruits, Dry:			Tea	"	25
Apples	"	50	Coffee	"	20
Prunes	"	50	Yeast	boxes	4
Figs	"	25	Soap	"	½
Raisins	"	35			

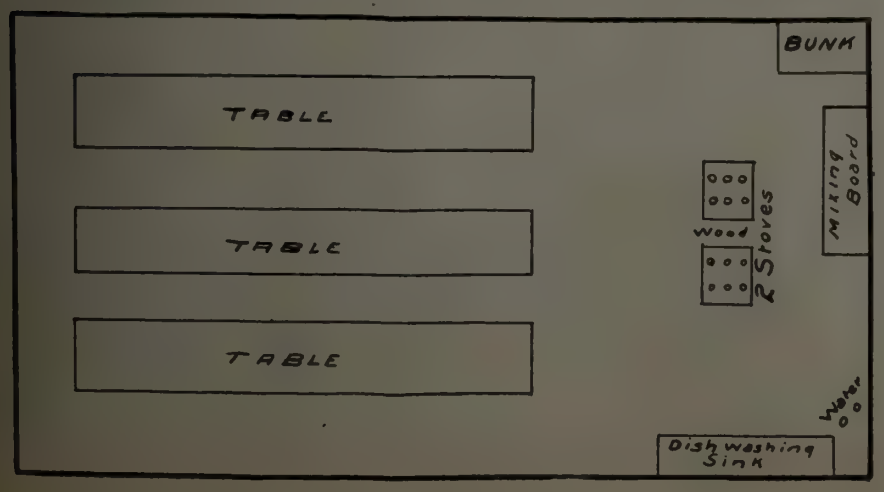
The average cost of food per man per day is forty cents.

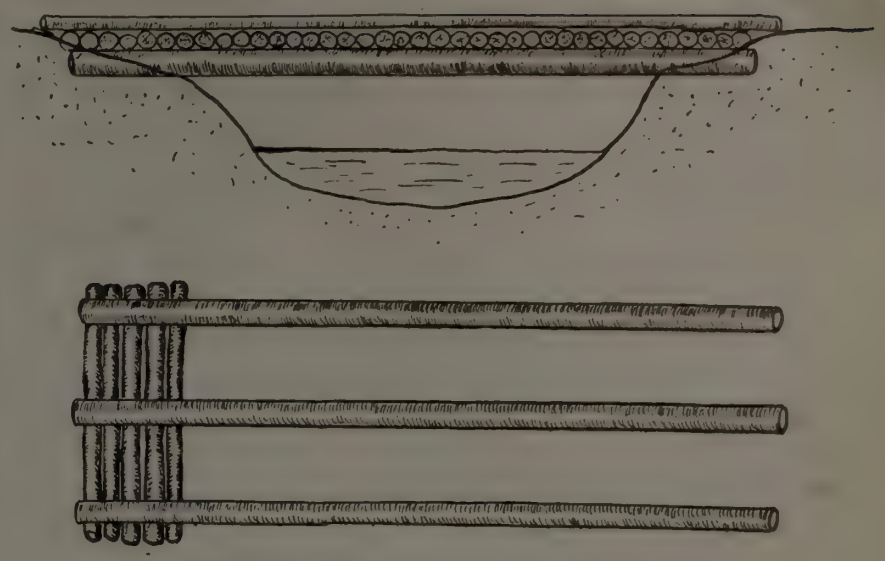
A store house and root cellar for provisions is located in the rear of the cook house.

The Bunk House: The two bunk houses accommodating 68 and 44 men respectively, are built higher than usually found in the woods, affording better ventilation and light, and are more cheerful and comfortable quarters for the men. The bunks are arranged endwise, two men to each bunk, and are supplied with three pairs of blankets per bunk. The total cost of blankets would be about $750. The bunk houses were supplied with soap and towels, and were kept exceptionally clean and well heated.

The Stables: Special attention was given to the stables; floors were made of fir, split and smoother, stalls double width, and kept very clean, by the chore boys.

The horses, thirty-two in number, are mostly Clydes, weighing from 28 to 32 hundred weight per team and valued at from $500 to $700 per team. The cost of maintenance per team per day is about a dollar, with the following feed, 1½ bushels of oats, 60 pounds of hay,





Small Bridge Construction—Position of Stringers

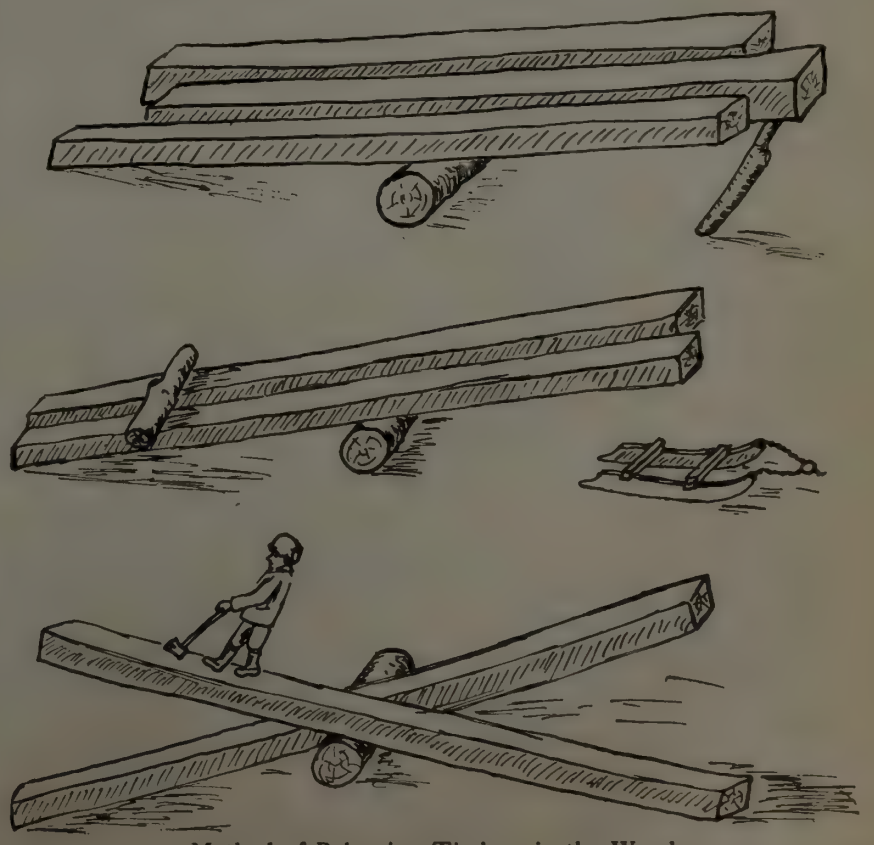
with an occasional feed of bran. Harness per team, $45 to $50. With the average life of a team at woods work, five or six years, and with $10,000 tied up in horse flesh, it can readily be understood why they receive the best of care.

A store house for hay and oats is situated to the rear of the stables.

The Blacksmith Shop: The woods blacksmith shop requires about the same equipment as the ordinary village "smithy." The blacksmith was well supplied with the necessary tools of his craft, also a stock of round and flat iron for general repair work. The entire outfit representing an outlay of from $200 to $250.

The Camp Store: The camp store, or van, occupied a few shelves in the office, a stock valued at $250 is sufficient to meet the immediate demands of the men. The following articles being stocked:—Tobacco, smoking and chewing; boots; oil tans; mocassins; gum rubbers; woolen underwear; woolen shirts; khaki shirts; mackinaw suits; tweed trousers; mittens; gloves; handkerchiefs; stationery; patent medicines. The system of keeping the accounts is very simple, indeed. The clerk or foreman, whoever happens to be in the office at the time of purchase, charges the amount of purchase into the "day book." At night the clerk transfers the account to the "ledger," to be deducted from the man's wages at the end of the season.

Roads: There is a series of ridges meeting the cadge road at right angles all the way in from Jocko, as well as a constant rise in general level. The road was built as well as possible under the circumstances, following in the main the contours of the country. However, in some places this would necessitate too extensive detours, so there are some pretty stiff grades. About 20 per cent. is the maximum for the haul from the railway to the camp, and of course, such grades are short. For the trip from the camp out with empty sleds,



Method of Balancing Timbers in the Woods

some short cuts have been cut across ridges, and as a result better time can be made. Some of these are so steep that they would appear impossible to the novice. The minimum grades are represented along swamps and sloughs and are consequently negligible.

Little or no grading has been done, chiefly owing to the rocky nature of the soil, which would make such work too expensive. The swampy places are corduroyed with poplar, fir and other wood of little value. The one bridge over the Jocko River is of very simple construction. Three stringers of unhewed spruce about 18 inches in diameter are used. The floor is of poles of any wood which was at hand when the bridge was built or last repaired.

No culverts are used; across wet places and small streams corduroy resting on stringers being employed instead.

A mile of road can be built in a week by ten men using two teams. The cost of each man in wages and food would average about $2.00 per diem. This, with the cost of horse feed, tools, etc., would bring the cost of the cadge road to about $175 a mile.

After snowfall the roads are ploughed with a snow plow of the ordinary wooden type, followed by a patent plow, and finally by a sprinkler. Oval shoes are used on the sleds, which gives the tracks a fine surface. No rolling is practiced in their operations. The foreman considered that rolling hardens the road from the top down, so that the horses punch through here and there instead of packing the snow down to a good firm road surface.

In case of wet snow, the lakes are tramped to penetrate the snow, allowing all parts of the snow to freeze with equal rapidity. At the same time the snow is prevented from forming a blanket over the ice, and thus preventing it from thickening properly. Holes are also sometimes cut in the ice in time of thaw to permit of flooding and freezing on the surface, and at the same time relieving the great strain put on the ice.

Logging roads are, as far as possible, laid out along the contours, or with a gentle slops toward camp. Grades here often run higher than on the cadge road, but only going towards camp. Their cost would be in the neighborhood of $100 a mile.

Two miles is the greatest distance from which timber is hauled, and is considered the maximum distance to which men can walk to their work without economic loss to the operation.

Logging Practice

From the standing pine to the waney timber at the landing, the work is divided between two distinct crews.

(a) Actual timber making, cutting crew.
(b) Skidding and yarding crews.

Timber making crew:

Crew	Tools	Cost of tools
2 Fallers	2 axes (pole), 1 cross cut saw, wedges...	10.50
1 Liner	1 chalk line and chalk	.25
2 Scorers	2 pole axes	3.75
2 Hewers	2 broad axes, right and left handed ...	5.00
1 Swamper	1 double bitted axe	2.00
		$21.50

This crew makes from nine to ten waney timbers per day; each swamper serves two crews; the liner several.

The first operation is carried out by the fallers who fall the tree, and do their own bucking.

The liner determines how much the log will square out, and lines it in by means of his chalked line.

He in turn is followed by the scorers, who hack to his line, removing the rough outside bark and wood.

The operation is finally completed by the hewers, who, working on each side of the log, right and left handed, are so expert in their trade that when finished, the waney timber presents a surface as smooth as though it had been planed.

The waney timbers are then left at the point of balance, ready for the yarding crew who simply tip them on to the sloops.

Yarding and Skidding

The snaking trails are built by the "road monkeys," to wherever the waney timbers are made and are merely brushed out so as to allow a team and sloop to get at them. The sloops are heavy bobs having ten-foot bunks and six-foot runs, the timbers are chained on to these sloops leaving one end free to drag.

The skidding trails are built so as to have the least possible grade, following the contours of the country to a great extent. Bad holes are filled, while low or wet places are corduroyed.

The skidways are located on the slough near the camp, at the mouth of the road leading to the railway. The number of timbers in a skidway varies from 100 to 150, remaining on the skids from the time they are cut at the beginning of September, till the last log is hauled to the railway, about March 15th.

Tastes Differ with Lumberjacks

What They Eat in an Ontario Camp and in a B.C. Camp —Comparisons of Food and Costs.

Feeding the men employed at a lumber camp is a much more extensive and complicated job than anyone who has not seen a logging camp in operation could possibly imagine. The vast quantities of food consumed at a camp, the difficulties which have to be overcome in the way of shipment from the place of purchase to the camp, the cost of keeping a sufficient supply continually on hand, the cost of preparing the food and serving it, all combined, furnish sufficient details to require a full sized man to look after them with any degree of success. Nevertheless, it is remarkable how the feeding of the camp employees has been reduced almost to scientific uniformity. Careful accounts kept by the cook and the foreman, and submitted to headquarters for periodical analysis should enable those who are responsible to check up the quantities and costs so that the amount needed for feeding a camp of a given number of men during a definite period may be estimated with sufficient accuracy in advance.

The statements of quantities and costs which are shown below were furnished to us by the companies themselves. In the case of the Ontario camp they refer to a crew of 100 men operating for seven months. The figures shown are reduced to a one month basis, by division by 7. The British Columbia figures furnished to us were for a camp of 50 men for one month. We have multiplied these figures by 2 in order to afford a basis of comparison with the Ontario camp. The figures shown are therefore on the basis of 100 men for one month in each case. A number of significant omissions will appear in some of these reports. In the Ontario case the figures shown are for the actual goods appearing upon a "board account" submitted by the camp cook for the season of 1915-16. Counting in the wages for the cooks and chore boys the actual cost of feeding the men in this camp works out at 53c per man per day. Other camps operated by the same company showed averages of 51c, 52c and 59c.

The British Columbia camp for which we have given figures presents a rather different result. Apparently, the party who drew up the B. C. list omitted a few items, though most of the items involving a cost of more than a few dollars are included. The B. C. list adds up in value to $1,799.88, which for a camp of 100 men for one month would show a cost of 60c per man per day. This B. C. average per man per day, however, includes only the cost of the food, while the Ontario list includes the cooks' and cookees' wages. Apparently, if these reports can be considered as typical, it costs about as much to purchase food for the men in a B. C. mountain camp as it does to purchase food and cook and serve it in the Ontario camp.

Following are the two lists:—

Article	Ont.	B.C.	Article	Ont.	B.C.
Allspice	$ .10	$ 3.00	Mustard	$ .20	.....
Apples	1.55	.....	Molasses	2.22	.....
Evaporated Fruits .	.....	7.50	Macaroni	.34	.....
Butter	63.51	75.60	Nutmeg	.64	.....

Lard	11.89	32.00			

The following comparative statement shows the quantity of the chief lines of supplies shipped in to a logging camp headquarters during the past three seasons. These supplies were for four camps in 1913-14, five camps during 1914-15, and four camps during 1915-16. It is not reasonable to use the figures for making comparisons of one year with another, as in certain cases stock was held over from one year to another, thus reducing the quantity purchased in the succeeding yeaf. As affording a fair idea of the quantity of the chief lines

consumed, however, the figures are instructive. They refer to camps of about 100 men each for seven months. The figures are as follows:—

	1913-14	1914-15	1915-16
Bacon ... lbs.	71,976	91,534	67,056
Beef ... "	21,057	32,108	29,294
Butter ... "	14,176	14,525	9,039½
Lard ... "	19,770	20,904	9,944

* Much of this held over for following year.

Interesting figures regarding the cost of feed for horses at camps in Ontario has been furnished also by the Ontario camp referred to in the above discussion of the cost of feeding camp employees. In four camps operated by this company the cost of feeding a team per day, as shown by actual results, worked out as follows:—

Camp A.

10 Bags Bran at $1.25	$ 12.50
714 Bales Hay at $1.08	771.12
712 Bags Oats at $1.53½	1,092.92
Freighting 174,384 lbs. at $14.70 per ton	1,281.72
	$3,158.26

1489 days team feed average cost per team per day, $2.12.

Camp B.

14 Bags Bran at $1.25 per bag	$ 17.50
842 Bales Hay at $1.08 per bale	909.36
1218 Bags Oats at $1.53½ per bag	1,869.63
Freighting, 243,516 lbs. at $14.70 per ton	1,789.84
	$4,586.33

2018 days feed teams average cost per team per day $2.27.

Camp C

19 Bags Bran at $1.25 per bag	$ 23.75
745 Bales Hay at $1.08 per bale	804.60
816 Bags Oats at $1.53½	1,252.56
Freighting 200,012 lbs. at $14.70 a ton	1,470.09
	$3,551.00

1667 days feed teams average cost per team per day $2.13.

Camp D

28 Bags Bran at $1.25 per bag	$ 35.00
133 Bales Hay at $1.08 per bale	143.64
982 Bags Oats at $1.53½ per bag	1,507.32
54¼ Tons Hay at $20 per ton at camp	1,085.00
Freighting 121,584 lbs.	893.64
	$3,664.60

1968 days' feed teams average cost per team per day $1.90.

Lumber Production Increasing in Cape Breton, N.S.

Until a few years ago, nearly all the lumber consumed in Cape Breton was imported from other parts of Nova Scotia and New Brunswick, the lumber manufacturing industry not having made any important steps in the way of development until quite recently. Of late years, a second growth of young trees, chiefly fir, or balsam, as it is often called, has attained such a size as to make it worth while for many farmers throughout the country to go in for the production of lumber. These farmers have put up small mills which now furnish practically all the framing and boards used in the farming sections. Along with the growth in the lumber industry there has also come considerable development in the woodworking line. The products of the Cape Breton woodworking plants of the firm of Chappell Bros. & Company, Limited, now find their way to every part of the island and include everything required in the line of finer building material.

The actual number of individuals or firms carrying on lumbering as a separate business, apart from farming or other lines, in Cape Breton is very small. Among them there are C. A. Fownes, Nyanza; E. W. Dryden, Baddeck; the Dominion Lumber Company, an American concern in Inverness County, and Chappell Bros. & Company, Limited, Sydney. The last named firm operate several mills and carry on lumbering in connection with their woodworking and contracting business. They also buy quite extensively from the other operators.

The Cape Breton Pulp Company own extensive limits in the northern part of the island and are now erecting a large pulp mill at Murray Ste. Anns.

Cape Breton may now be said to be self-sustained in regard to the production of small lumber suitable for framing for small buildings, while material for large buildings must be imported. The woodworking firms also have to import large quantities of boards, both spruce and pine, for manufacturing purposes.

A Logging Camp's Hardware Bill

Sufficient to Stock a Fair Sized Store—Lumber Price Cutters Should Read This Carefully.

The hardware supplies required in a logging operation include a great variety of articles. Under the heading of hardware, in the requisitions for a camp there come a number of articles that might be considered as scarcely of the hardware type, but for purchasing purposes they are grouped together, as a rule, for the sake of simplifying the work of making out requisitions. In connection with four camps operated by an Ontario manufacturer during the season of 1915-16, each camp employing about one hundred men for a period of seven months, the requisition for hardware included the following articles:

50 doz. D. B. axes.
86 doz. D. B. axe handles.
20 doz. S. B. axes.
50 doz. S. B. axe handles.
40 lbs. axe stones.
600 Cant hook bolts, 2 x 7/16 in.
10 Alarm clocks.
48 bbls. coal oil.
700 ft. ¼ in. B.B.B. chain.
514 ft. 3/8 in. chain.
4 doz. curry combs.
8 large dressing combs.
1 doz. 3 qt. dippers.
48 doz. 7-in. mill files.
34 doz. 6-in. taper files.
2 doz. 5-in. slim taper files.
1½ doz. 14-in. mill files.
4 Flour sifters (diam. 14 in.)
24 Grindstones, 1½ x 24 to 30 in.
1 box Glass, 10 x 12 in.
8 boxes horse shoe nails, No. 10
8 boxes horse shoe nails, No. 9.
10 kegs No. 5 horse shoes, assorted. fore and hind.
15 kegs No. 6 horse shoes, assorted, fore and hind.
1 doz. Farriers' knives.
1½ doz. 14-in. shoeing rasps.
24 doz. hame straps.
40 prs. heavy hames.
1 doz. 3 lb. wedge hammers.
4 only 6 lb. drilling hammers.
400 lbs. 5/16 round iron.
600 " 3/8 round iron.
800 " 7/16 round iron.
1600 " 1/2 round iron.
1600 " 5/8 round iron.
1200 " 3/4 round iron.
400 " 7/8 round iron.
600 " 1½ x ⅜ Swede iron.
300 " 1-in. sq. Swede iron.
200 " 1½ in. band iron.
50 " 1 in. band iron.
300 " 2 in. band iron.
300 " 1½ x ¼ in. Swede iron.
150 " 2 x ¼ in. common iron.
4 butcher knives, 10 in.
4 butcher knives, 12 in.
4 doz. lanterns.
36 doz. lantern globes.
24 doz. lamp glasses.
8 soup ladles.
192 yds. 1-in. lamp wick.
6 doz. lamp burners.
10 bbls. lime.
8 doz. pick mattocks.
8 doz. mattock handles.
½ doz. mirrors, 10 x 12.
3 kegs 2½ in. wire nails.
25 lbs. 7/16 nuts.
75 " ½ in. nuts.
75 " 5/8 nuts.
75 " 3/4 nuts.
50 " 7/8 nuts.
200 rolls tarred felt.
4 large mixing pans, 22½ x 19 x 9".
6 large dish pans.
20 lbs. putty in 5 lb. bladders.
8 doz. 1-in. harness snaps.
12 doz. 1¼ in. harness snaps.
6 doz. 2-in. harness snaps.
2 doz. R. M. shovels.
4 doz. Simond's cross cut saws, 5½ ft.
16 doz. Simond's "Olsen" saw handles.
24 bars C. H. steel, 1 x ½ in.
6 bars 1⅛ Oct. tool steel.
8 bars 2 x ½ in. soft steel.
2 doz. 5 x 1¾ in. sheaves.
2 doz. solid leather top pads for team collars.
8 tea boilers, 18 x 18 in.
5 doz. galv. pails, flaring, 14 qts.
1½ doz. wash basins.
1 doz. wash boards.
20 lbs. 7/16 washers.
20 lbs. 9/16 washers.
30 lbs. 11/16 washers.
30 lbs. 13/16 washers.
30 lbs. 15/16 washers.
30 lbs. 17/16 washers.
8 fire back grates for No. 25 Adam Hall cook stove.
8 fire front grates for No. 25 Adam Hall cook stove.
12 cross sections for top of No. 25 Adam Hall cook stove.
12 stove lids, 10 in., for Adam Hall cook stove.
1 fire front grate for No. 26 "Leader" Adam Hall cook stove.
1 fire back grate for No. 26 "Leader" Adam Hall cook stove.
4 doz. corn scrubbing brushes.
8 doz. corn brooms.
12 doz. knives and forks.

Any wholesale lumberman, or retailer, who has not had an opportunity of visiting a logging camp in operation will do well to look over this list and the lists of food for men and feed for horses, published elsewhere in this issue. The perusal of these lists will act as a good tonic for anyone suffering from price-cutting fever.

The Camp Food Bill Steadily Soaring

Where do the Provisions come from and why are they so expensive? The problem growing daily more difficult

How many lumbermen, aside perhaps from those who are actually responsible for the purchase of supplies for a logging camp, appreciate the extent of the business involved in furnishing loggers with good food? Everyone in a logging camp understands well enough how important it is, both from the point of view of results and from the point of view of the employees' health that a wide variety of palatable and good food should be furnished at the camp table. There is no doubt, indeed, that one of the chief factors in connection with the successful management of a logging camp is the furnishing of a good table. Of late years this fact has become increasingly important on account of the rising cost of labor and the readiness of the average employee to dig out for pastures new upon the slightest provocation.

In the solution of the food problem for a lumber camp the large wholesale provision houses and grocers at such centres as Toronto, Montreal, etc., play an exceptionally important part. With their skilled and extensive organizations, their large capital, their intimate knowledge of world-wide markets, and their specialized knowledge of the requirements of lumber camps, they have made it possible for the camp foreman to obtain, with little loss of time, a range of food stuffs that would have been considered entirely out of the question even a few years ago.

When one goes back to the early days of pork and beans and the few other lines that were then sufficient for the camp menu, and compares conditions in those days with the conditions of today, the contrast is almost too great to appreciate. Two factors have been of chief importance in bringing about this development. One, of course, has been the growth of railroad facilities in Canada, making it possible to deliver goods rapidly to the very threshold of the logging districts. The other factor has been the business ability of the great wholesale houses that have established their extensive buying connections and have created large warehouses to act as supply depots for the men in the camps.

Take the wholesale grocery business, for instance, and consider the lines that it furnishes. We do not intend to present an exhaustive list, but simply to indicate something of its variety. Some of the most important items are white beans, evaporated applies, coffee, tea, canned tomatoes, corn, peas, and beans, lard, butter, prunes, tobacco, salted meats, canned milk, canned apples and rhubarb, dried fruits, such as currants and raisins, rolled oats, corn meal, syrup, etc. These few lines are sufficient to indicate the variety and to suggest something of the extent of business centralized in the wholesale grocery establishments that cater to this trade.

Many Countries Contribute to the Menu

If we were to trace the origin of most of these articles we would have to journey to practically every quarter of the globe. Take the case of prunes, for instance, today they are coming almost exclusively from California. Not many years ago they were coming from Austria, Bosnia, Servia and France. Of late years the production of prunes in California has been developed to a great extent and today a very good grade of prune is coming from that market.

Every camp consumes a large quantity of sugar, both yellow and granulated. The war has had a great effect upon this article of food. Just before the war, yellow sugar at Toronto was selling at $4.11 a hundred pounds, and best granulated at $4.51 to the retailer. Today the respective prices are $7.46 for yellow sugar and $7.86 for granulated. The cause of this great increase is rather curious. First of all it is the result of the cutting off of the world's most extensive source of supply in the central districts of Europe, where the beet growing industry for the production of sugar had been developed to an enormous extent. These districts used to produce nearly one-half the sugar consumed in the whole world. The chief producing districts were Germany, Austria, Belgium and Northern France. In the other producing countries, the output has been increased as far as possible in order to offset the reduction of output in central Europe. Price advances, moreover, have resulted in a slight decrease in the consumption.

The Price Fluctuations of Sugar

At the outbreak of the war there would have been a far greater advance in the price of sugar had it not been for the fact that available stocks on hand were then greatly in excess of the requirements under normal conditions. In fact, during the summer of 1914, producers and holders of raw supplies were facing a situation which would unquestionably have necessitated reduced production if conditions had not been entirely upset by the commencement of the war. As it was, the enormous available stocks kept the price from maintaining its earlier advance. The advance that did occur was of a more or less sentimental nature, but it was soon offset, and not until last fall, when the over-supply had been worked off, did an advance based upon supply and demand take place. Since then the price of sugar has gone up about $2 a hundred pounds, but during the past month there has been a drop of about 40c a hundred pounds. Today the greater part of the sugar consumed in Canada comes from the British West Indies and is refined in Canada.

Tea is another staple article at all lumber camps. The principal tea consumed in the camps comes from China, Japan, India and Ceylon, being chiefly such as Japans, and Young Hysons and Congous from China. Coffees are brought from South America, Central America, Mexico, China and Arabia. The principal coffees used in the lumber camps come from Brazil.

Of the goods produced in Canada, one of the most important lines is canned products. All the canned fruits and vegetables furnished to the logging camps are grown and put up in Canada. Another exclusively Canadian product used in lumber camps is salted meat. The quantity of this line of food consumed is very great, and in this connection, the wholesale houses are of great service, because they enable the lumber camps to draw upon their supplies from time to time and thus obtain, on very short notice, exactly what they may require, without being obliged to carry large stocks at the camp. In times like the present when prices are high and stocks are scarce, it is of much importance to the camps to be able to make use of the ability of the wholesalers to anticipate the markets' requirements and carry sufficient stocks to meet the demand.

Speaking of market conditions, especially in reference to the goods required by the logging camps, a prominent wholesale grocer remarked with much interest upon the fact that the lumber camps today are using a much superior class of goods to that which they used twenty-five years ago. In the earlier days, camp employees were not so particular about their food. They were paid small wages and had to eat pretty much what was available. They had not been educated to an appreciation of good things to eat as they are today. Now-a-days, a camp employee wants the best he can get, and unless it is served up to him he will not stay. The improvement has been both in variety and quality and has involved a corresponding increase in the cost of labor.

Higher Prices and Their Causes

There is no doubt that the cost of provisions for the men in the camps today will average 25 per cent. higher than the cost immediately before the war. Take the case of cheese, for instance, it has advanced quite fifty per cent. Teas are about 25 per cent. higher. Meat products are at least fifty per cent. higher. Dried fruits are far more expensive than they were. An interesting line is mustard. Before the war practically all mustard seed came from Austria and was ground and prepared in England. The mustard manufacturers in England have had to scour the world since the Austrian source of supply was cut off and prices have naturally gone up to a great extent.

The prospect for canned goods this year is for very high prices. In fact the same thing may be said for nearly all lines of groceries. Canned vegetables are already scarce and the new pack will be light because the drought has dried things up. Moreover, the drought has had an effect upon consumption. People who in former years would be using their own garden stuff, are this year consuming canned goods, and have helped to produce a scarcity. There seems to be no question that canned goods will be both scarce and expensive for some time to come.

Meats also will be high in price. The chief factor in this regard is the war. The armies are consuming far more meat than the same number of men would consume under ordinary conditions. Their work is such that they need large quantities of meat food. The production of meat is also falling off. The high price of cereals induces farmers to sell their cattle earlier than under normal conditions, rather than hold them until they are larger and bring better returns. They think of the good price they can obtain for their cereals, as cereals, and think they are doing better by selling the cereals than by feeding

them to cattle and pigs. The wholesaler to whom we referred above expressed the opinion that this situation was likely to develop into something serious, and even suggested that governments ought to consider the advisability of regulating the sale of young calves and pigs by law, so as to prevent them being killed off at too early a stage.

Taking everything into consideration, it is no difficult matter to predict today that lumbermen will have greater trouble during the coming winter in securing foodstuffs for their camp employees than they ever had before, and that prices for practically all lines are certain to be high. Although these views are secured directly from a wholesale grocer, we believe that the experience of lumbermen will verify everything that has been said. Taken in conjunction with the advancing cost and the decreasing efficiency of labor, the situation becomes critical and seems to involve heavy reductions in the output of logs during the winter of 1916-17.

Portable Sawmill Problems—

Conditions under which this method is found profitable in Great Britain

The use of portable mills has become so widely prevalent in many parts of eastern Canada, and to some extent in other parts of Canada as well, that most lumbermen understand fairly well the conditions that are favorable to a portable operation. Not unlike the conditions in eastern Canada are those prevailing in Great Britain, though, of course, there are also many important lines of difference. The way in which the matter is viewed in Great Britain is outlined in an article in a recent issue of the Timber Trades Journal of London, Eng. Many contrary opinions have been expressed from time to time by men of long experience as to whether portable sawmills are a profitable asset to the timber merchant, this article says. Many of those opposed to them contend that they lead too much to decentralization, increase management expenses, and cause too much dissipation of energies. Others, again, believe that they are too wasteful, that they cannot economically utilize a great deal of offal which would be used up in a central mill, and consequently that it pays better to bring all timber home.

A great many arguments may be brought forward to support these contentions, but the most likely factor in creating the adverse idea in the minds of those who have lost money on portable sawmills is that they have not had the right man to manage them. It is a very easy matter to lose money, and a very different proposition to make it.

Many mistakes have been made by portable sawmillers in converting timber unsuited to such methods. In breaking down timber that is too large for the machinery a great deal of unnecessary waste is incurred. This particularly applies to sawing plank on a rack bench. Even if the timber is not too large, a big lot of wood is wasted in the excessive saw kerf. And with timber that is outsize, not only is there waste in saw kerf, but the slabbing cuts to reduce the log to the depth of the saw means a waste of valuable timber, and decreases the width of the plank by a very considerable percentage. If the sawyer attempts to keep the plank the full width, and turns his log to meet the cut, the chances are a hundred to one against the cutting being accurate; and this, again, would entail waste, and probably spoil the sale of the plank owing to bad cutting. In this sense, then, where portable mills consist solely of circular sawing machines, they are not profitable for planking, a process which should preferably be undertaken in stationary mills where proper log-sawing machines have been put down for boarding and planking logs in their full width.

Another objection to portable mills is that they are, as a rule, put down in out-of-the-way country places where there is no sale for the sawdust, and the inevitable accumulation of large piles of slabs and firewood—items which in a town mill bring the proprietor in quite a large amount annually. There is no doubt that this is often the case, as may be frequently witnessed in the piles of slabs and sawdust left behind after the mills have been removed. Very often, however, local farmers will buy up most of the slabs that may not be required for fuel for the engine at a good price for rough outbuildings and fencing. Then, again, the arrangement would probably be advanced by those who believe in the portable mill that all carriage would have been saved on this waste, even if no sale were effected, and that the cost of carriage would represent much more than its actual value.

The main question that is bound to arise in the minds of those interested in this subject is: When are portable mills profitable, and when do they reach that point where they cease to be a paying proposition?

Portable mills are undoubtedly useful to those merchants who possess no main stationary mill, and whose principal business consists of selling timber in the round. In a very large lot of home-grown timber of mixed varieties there is bound to be a considerable quantity of rough timber which would scarcely pay for the handling if put on the market in the round. In a case like this a portable mill is useful for converting the rougher timber to the best advantage, and thus obviating all carriage except upon the actually marketable article. By dealing with the timber in this way the merchant is enabled to make a selection of his better timber, and therefore can demand the highest market prices.

The merchant who possesses a stationary mill can work a portable mill on similar lines if his timber is at such a distance from his converting centre that the carriage upon the rougher timber would render it unprofitable to bring it home. But at the same time such a step would only be warranted by there being sufficient timber to keep the portable mill employed, and sufficiently close so that the hauling to it would not be an expensive item, and providing that no attempt should be made to convert the better-class timber which could be more profitably worked up in the home mill.

There are one or two classes of trade in which portable sawmills are profitable for converting practically the whole of the timber. One class particularly is that of dealing with a fir or pine plantation. In fact, many portable mills are already down, or are being put down today for this purpose, the timber being exclusively converted on the spot into sleepers, deals, battens, scantlings, and boards, as well as for mining and fencing purposes. Practically the last piece is worked up in this way, and the carriage is absolutely confined to the converted timber; and at the present high prices ruling for such goods some highly profitable business is being done in those cases where sufficient labor is available to keep all ends fully employed.

We are, however, not so much considering this question from the present abnormal point of view, where such operations are being carried on for temporary purposes only, as for normal times, when the usual competitive and low-cut prices have to be contended with.

Another class of trade in which portable mills are extremely useful is that of cutting oak wagon scantlings, providing the timber is not too large to be handled by the machinery with which the mill is equipped. A very good line to run in conjunction with wagon scantlings is that of oak fencing materials, in which case one or two cleavers should be kept on the spot for cleaving spokes and pales. As far as we can judge at present there will be a much increased demand for wagon scantlings immediately the war is over, and if present prices rule, standing oak will fetch higher figures, and merchants will necessarily have to study the most economical methods of handling their timber; and those who have their portable mills for converting coniferous woods to-day will find a good opening for them in this respect.

In some districts where merchants make their main business that of selling timber in the round, to help themselves with the rougher butts and large tops they hire the portable mills, and pay the owners upon a piecework basis of so much per cubic foot for the converted timber.

One of the greatest difficulties with regard to a portable mill is that of finding a suitable site near a plentiful water supply. During a dry summer the water has sometimes to be carried a long distance, and this necessarily adds considerably to the working expenses.

To sum up, we may say that the chief points to be studied in using a portable mill are:—

(a) The right man to manage, so that expenses are kept down to a minimum.

(b) The conversion of timber that is unprofitable to deal with in any other way.

(c) The necessity of having an ample accessible supply of such timber to keep the mill fully employed.

(d) The proper roofing-in of the mill, so that work can be carried on, wet or dry.

(e) The cultivation of a local trade, as far as possible, for the profitable disposal of sawdust and offal.

B. C.'s Timber Scale for June

The timber returns for British Columbia during June, issued by the Department of Lands, show that the total scale of sawlogs for the province amounted to 120,023,869 feet, board measure, in addition to 375,905 lineal feet of poles and piles, and 28,840 cords of ties, shingle bolts, etc. The sawlogs scaled in the various forest districts include Vancouver, 78,439,270 feet; Cranbrook, 12,744,444 feet; Island 11,333,874 feet; Vernon 7,339,997 feet; Nelson 4,288,647 feet; Prince Rupert 629,736 feet. 160,263 lineal feet of poles and piles were scaled in the Nelson district, 70,619 lineal feet in Prince Rupert, 50,178 lineal feet in Hazelton, and 55,080 lineal feet in the Vancouver district. Of the ties, poles, etc., 20,196 cords were scaled in the Vancouver district; 5,225 cords in Cranbrook, and 2,289 cords in the Nelson division. Timber sales recorded during June cover an estimated total of 6,195,500 feet of sawlogs; 19,800 lineal feet of poles and piles, and 300 cords of bolts, etc.

Logging Flume Construction and Its Use

Description of Methods Adopted in Modern Practice of Fluming in the Western Mountain Districts

By W. D. Starbird*

Water, in one way or another, is a factor in almost all methods made use of by loggers and lumbermen in moving forest products from one point to another any considerable distance. The lakes and streams of this country have been and are still being extensively utilized for floating logs, lumber and other timber products from the forests to some desirable point for the location of mills and factories.

The method most commonly used is to dump large quantities of logs into some running stream and float them with the current to the point where the manufacturing plant is to be located. This is commonly known as log driving, and, in some instances has proven a very economical and satisfactory means of transportation; but as the lumber business has developed and grown in magnitude the forests lying along such streams as were readily adapted to this use have been denuded until now those that can be made available for the purpose at all generally require expensive improvements before they can be utilized in this manner. This is particularly true of the mountain timber districts in the west, where many of the streams flow through rough and rugged country, in rocky channels, with such steep grades and swift currents that it is impractical to make use of them in floating logs, consequently many large and valuable tracts of the finest kind of merchantable timber can only be made available by some other means. Railroads can be made use of to advantage in some instances, and have been built and utilized extensively. They are, however, frequently impracticable owing to steep grades and the high cost of construction and operation.

Wherever such conditions prevail, a flume will usually solve the problem, and frequently will prove a cheaper and more satisfactory means of transportation than any other, even when the other methods mentioned are feasable.

The transportation of logs by flume is feasible wherever there is an available supply of water that can be diverted into the flume box at a point having sufficient elevation above the desired point of delivery, to insure flowage. These are the only two essentials—given them, all other difficulties and obstacles may be overcome.

The extreme flexibility of the flume as to grades and curvatures, and the ease with which it may be constructed over extremely rough, rocky and broken country by trestling instead of making costly cuts, gives it a great advantage over the railroad in any mountainous country, and makes its use entirely practicable in places where the latter is utterly impossible.

Transportation flumes are ordinarily built on trestling, and a difference of a few feet in the height of the trestles adds but little to the cost of construction, and none to their successful operation. It is largely due to this feature that they can be built much cheaper than a railroad, especially in the mountains. On hillsides, where grading for a railroad would be heavy, all that is required for a flume is two, or at most four, footings every sixteen feet. Where large boulders and rocks are encountered they can be passed over with a flume by means of trestling, when building a railroad would entail expensive blasting, cutting and filling. When trestling for a railroad is practicable, they must be constructed much heavier and more expensively than for a flume. A flume can be built at a practicable cost, and successfully operated on steep and rocky hillsides, over or around rock cliffs, and through narrow, rockbound, winding canyons, where a railroad could not be considered possible at any cost.

With reference to the engineering and construction of flumes for transportation purposes, I will endeavor to outline as briefly as possible the more important features, as shown by my experience and study of the subject.

Triangular Box Gives Best Results

First, it should be understood that all of the information and data given is based on a flume box of triangular shape. This design has been fully demonstrated to be the most desirable and efficient in operation. Several slight variations, such as flattening the bottom or building the side walls with a greater or less angle than 45 degrees from perpendicular, have been tried, but in every instance I am convinced the triangular box would have given better results. The principal reasons for this are that, in fluming a log or other stick of timber of any size, in a box of triangular design, there is always a space between it and the bottom of the flume box, where water will be flowing, which assists in buoying it up and keeping it in motion. The 45 degree angle of the side walls seems to be exactly what is required to carry water around curves with the least amount of disturbance and slopping, which results in waste and reduces efficiency. This angle of the walls also seems best adapted to carrying around curves logs which are either too large in diameter or too long to lay at their normal level in the water, on account of the curvature. When such condition occurs the water rises toward the top of the flume box on the outside of the curve, taking with it the end of the stick being floated. This leaves the front of the log well down in the flume box, and with its back end forced up, sometimes above the top of the flume, thus relieving the tendency for it to bind in passing around the curves. It can readily be seen that if the flume box had perpendicular sides this would not be possible, and that if the sides were at a steeper angle than 45 degrees from perpendicular, this action of the water and the log would not occur so readily.

The grades on which a flume may be built and successfully operated can be as steep as 25 per cent., and under certain conditions even steeper, or as flat as one-tenth of one per cent., although such extremes are seldom necessary. Uniformity of gradient is not essential to the successful operation of a flume. If engineering and construction are properly done the grade may be changed from one extreme to the other in a comparatively short distance without materially affecting its efficiency, although it is always desirable to avoid making any change in grade too suddenly or more often than the conditions require, because of their tendency to increase wear on the flume box

* Sawmill Architect and Consulting Engineer, Portland, Ore.

and to cause jams or clogging of material being floated. The curvature permissible in log flume construction will depend on so many different factors that it can only be determined, in each particular case, after all the conditions and requirements have been ascertained and are understood. The principal controlling factors are: The dimensions of largest timber to be floated, the volume of water available, and the percentage of grade at the curve. Given an ample supply of water and a flume box of suitable size, any stick of timber could be floated around any curve. It is seldom, however, that there is any necessity for curves sharper than twenty degrees, although thirty and even forty degree curves are sometimes practical.

Generally speaking, if the size of the flume box is figured close to the requirements necessary to float a log of the largest diameter to be handled, a maximum curvature of twenty degrees can be allowen for logs up to twenty-four feet in length, ann twenty-five degrees for logs over twenty feet in length. Under similar conditions a curvature of from eight to ten degrees would be the maximum for logs forty feet in length. It must be remembered, however, that increasing the size of the flume box (in proportion to the size of the log) at the curves will permit of their being made sharper, assuming that there is a sufficient supply of water. These statements are based on the presumption that the longest logs handled will not be cut from timber of the largest diameter, and that the sharpest curves will not be necessary where grades are exceptionally flat.

Small Volume of Water Necessary

The water supply necessary to make the use of a flume practicable also varies to a considerable extent according to controlling conditions. Many people have a greatly exaggerated idea of the volume of water that is required to operate a flume successfully, especially a log flume. As a matter of fact, less water is necessary for the successful floating of logs up to four feet in diameter than for floating lumber of the dimensions commonly known as yard stock. In fluming logs the volume of water which it is absolutely essential to have is only enough to slightly more than fill the space in the flume left under the largest log to be floated when it is lying in the flume box and being supported by it. By taking the precaution in shipping of placing smaller logs behind the larger ones, a still smaller volume of water will be sufficient to flume them successfully. This statement applies to any gradient which the flume may have at the point from which the logs are started, providing it is steep enough to give them headway before they arrive at either a flatter or steeper grade in floating down the flume.

The steeper the grades are the greater capacity a flume will have without increasing the volume of water required. Owing to the velocity attained by a log running on the steeper grades its buoyancy is increased, and this added buoyancy, together with its momentum, causes it to move faster than the water on which it is floating. The result is that it banks the water in front of and around itself, creating an increased body on which to float. On flat grades, up to four or five per cent., if a log is too large to float free without riding on the sides of the flume box, its progress will be retarded and the water will accumulate around and behind it, forming a head sufficient to keep it floating, providing there is enough water in the flume to fill the space under the log, as before mentioned. This is, of course, assuming that the flume box is large enough to carry the required depth of water to float the log free. Increasing the size of the flume box and the volume of water permits the use of sharper curves.

An unlimited supply of water is, needless to say, always an advantage, but the point I wish to make perfectly clear is, that it is not essential to the successful operation of a log flume.

When the natural flow of water available for a flume project is not sufficient to meet the requirements, storage ponds can generally be constructed without incurring prohibitive expense, and plenty of water secured for fluming a part of the time. The capacity of a flume for floating logs is so surprisingly great that it will usually handle all that is required in four hours or less per day. By using storage ponds the natural flow of water could be increased during shipping hours from four to six times.

The length to which a flume may be extended without prejudice to its practicability or economical operation, is limited only by the possibilities for obtaining a sufficient supply of water and the maintenance of a descending gradient. I have had supervision over the engineering and operation of one flume in particular which was continuous for a distance of over thirty miles. There are flumes in California, used for carrying lumber, which I am informed are fifty to sixty miles long. Any flumes more than two or three miles in length should, if possible, be provided with feeders at frequent intervals; that is, an additional supply of water should be secured and run into the flume to replenish what will have been lost by leakage, splashing and evaporation. The water for these feeders may be obtained from the same stream as the original supply, or from tributary creeks and springs. Even when all the water visible on the surface has been taken from a mountain stream at any point, a considerable further supply will usually appear within a comparatively short distance down its channels. This fresh supply, or that from any other source, can be conveyed to the main flow by means of cheaply constructed flat-bottomed feeder flumes built on a very flat grade, which ordinarily avoids the necessity of their being of any considerable length. It is not essential to have these feeders except when the original water supply is very limited, but they are always a benefit in operating.

Long Length Timber Handled Successfully

In the engineering of the flume on Rochat Creek, in Idaho, which I built several years ago for the Milwaukee Land Company to float logs up to forty-eight inches in diameter and twenty-four feet in length, and poles and piling up to thirty inches in diameter and forty feet in length, grades to 17 per cent. and curves to 20 degrees were put in. This flume was the first of its kind built for floating logs, and it proved a very efficient and satisfactory means of getting out their timber when every other means had been given up as impossible or too expensive. Logs were successfully run through this flume with less than two cubic second feet of water available.

In considering flumes the essentials necessary to make them efficient, practicable and desirable for logging purposes are simplicity of design and economy in construction, combined with strength and rigidity of the structure. Foundations should be carefully prepared and the trestling and stringers of ample dimensions to give the necessary strength without waste of material. The entire structure should be carefully and judiciously designed to meet the requirements of each particular proposition. No fixed rule can be made that will apply in all cases with regard to the dimensions of any part. Varying conditions necessitate different methods and styles of construction. Where sawn lumber and timbers are difficult and expensive to procure, round timber can be used for everything except the brackets and flume box. I have used round sticks entirely in erecting the trestling for several log flumes where sawn timbers were difficult to obtain, and expensive. In other instances I have made use of poles for high trestles in pre-

Crows Nest Pass Lumber Co. Flume—Note Creek Cross Rig and Cribbing Along Banks of Creek to Prevent Washing out of Foundation.

Adams River Lumber Company Flume—Junction of a Feeder With Main Flume.

ference to sawn timbers, when they could be conveniently procured adjacent to the line of the flume. In one instance a trestle 80 feet high and several hundred feet in length was constructed entirely of this kind of material.

The flume box may be built of rough sawn lumber of any width and suitable thicknesses to meet the requirements. A single thickness can be used with battens between brackets on the outside, or two thicknesses can be used with joints broken and cracks lapped, or a single thickness may be used by planing with tongue and groove. When wide plank can be obtained I prefer to use a single thickness and batten, but when box material must be used in narrow widths it is preferable to tongue and groove, or use two thicknesses.

The cost of constructing a flume will depend on its size, the difficulties encountered, and the cost of labor and material. A flume having sides 54 inches high, measuring along their surface, which would be large enough to carry logs from 48 to 60 inches in diameter, depending on the species of timber and its specific gravity, could under the most favorable conditions be built for as little as $4,500 per mile if all sawn lumber and timbers were used in its construction and delivered to the construction crew at a price not exceeding $10 per thousand feet, providing common labor could be secured at a wage of $2.25 per day.

A fair average cost for such a flume would, however, be somewhat higher, probably from $5,000 to $6,000 per mile. These figures are intended to include the cost of engineering and the construction of a telephone line, which should always be a part of the system. Flumes of larger or smaller size and capacity would cost proportionately more or less, according to their dimensions and length, except that the cost of engineering and telephone line would be approximately the same, regardless of the size of the flume, The heavier material necessary in large flumes can be worked into the structure at a somewhat lower cost per thousand feet than the lighter material used in the smaller one.

The material required to build a flume of the size mentioned, viz., with 54-inch sides, would be from 225,000 to 300,000 feet of lumber, and from $250 to $300 worth of nails and other materials, per mile.

Cheap Means of Transportation

The cost of shipping logs by flume is surprisingly low. The principal items of the total shipping cost are getting the logs into the flumes, patrolling and maintaining. There are various methods for loading or placing logs into the flume. When practicable the cheapest and best way is to provide ponds into which the logs are dumped, and from which they can be floated into the flume direct or through a short branch flume. In this way one or two men will ship out as many logs as the flume will carry up to 40,000 or 50,000 feet per hour. Where a pond is not feasible, skidways can be utilized, built up along the side of the flume to a convenient height for rolling logs in over the top of either side. If the shipping point cannot be located where this method is practicable, a "jammer" can be used to good advantage. In several instances log chutes have been extended to the side of the flume and paralleling it, where there was an ample supply of water, and the logs were shot or propelled to the point where they would drop into the flume.

The maintenance cost of any flume will depend largely on the skill and care with which it was designed, engineered and erected, and the quality of material used in its construction. The principal items of cost will come from leaks caused by faulty workmanship, settling of the flume box by reason of these leaks or poorly prepared footings for the foundations, and the wear of the flume box, the greater part of which can generally be charged to impracticable curves, either horizontal or vertical, or perhaps both. The wear of the flume box is ordinarily very slight, even when there is a short supply of water. The surface of the flume box soon becomes water soaked, and the wood becomes more tough, stringy and slippery in consequence. The water keeps it thoroughly lubricated and reduces the friction until it is almost completely impervious to the wearing effects of the logs or other material being shipped, even when dragging or riding on account of scant water supply.

As an example of this, and the low cost of upkeep on a well-constructed flume, I will again refer to the one built for the Milwaukee Land Company. There was shipped through this flume during the first year of its use about twenty million feet of logs without any expense for repairs, and with no patrol. The greater part of the fluming was done after the available water supply reached a low stage, and was insufficient to float a large percentage of the logs handled, except as they accumulated their own head to carry them. The only visible wear on the flume box was on the curves and steep grades, where the sides were smoothed off almost as though they had been planed. The most remarkable feature in connection with this record was that the flume was completed late in the fall previous to the shipping mentioned, which was done the following summer. During the winter there was an unusually heavy snowfall that buried the flume to a depth of several feet, and in the spring there were freshets and extremely high water in the creek along the banks of which the flume was built, and in the canyon through which both passed. For some time portions of the flume were completely submerged, and yet the shipping was commenced and finished for the year without any repairing of the structure.

Generally speaking, there should be a telephone system in connection with the flume to be used for transportation purposes, especially if it is to be of any considerable length, and instruments located at intervals along the line of the flume. These points are commonly designated as stations. There should be one of these stations at every dangerous point, if there are any, and, in any event, every two or three miles. Men should be placed along the line of the flume to patrol it from one station to another. The duty of these men should be to inspect the structure and watch for weakening places, and repair them if possible. In case of serious trouble of any kind pertaining to either the flume itself or its operation, which they are unable to remedy alone, they would report by 'phone to headquarters, which is usually at or near the point at which shipping is being done. Barring serious accidents the cost of keeping these men on duty will be the only cost of maintenance except for a few nails and an occasional piece of lumber.

Maintenance Cost is Surprisingly Low

The ordinary life of a well-constructed flume built of such woods as fir, larch or spruce, and kept in operation and in reasonable repair, should be at least twenty years, and under favorable conditions much longer. The only wear on a flume is in the box, and this can be lined with one inch, inch and a quarter or inch and a half lumber when it has worn enough to require it, and relined as often as necessary to keep in good working order. There being no wear on the balance of the structure, deterioration comes from decay only, and its life will depend on the species of timber used and climatic conditions.

To illustrate the durability of this class of flume, I will cite the following example: In 1893 the first section of what later developed into a very extensive flume system was built in Wyoming by a company with which I was connected. Lodge pole pine, which is about the only kind of timber in that part of the country, was used in its construction. After this flume had been in successful operation for about three years I severed my connection with the company and left, but returned to resume the management of its affairs again in 1908. In the meantime the company had been operating intermittently, and many miles of additional flume had been constructed. Several miles of the first section built was still being used, however, and all of the hundreds of millions of feet of logs, ties and lumber that had been handled were shipped through it. The flume box had been relined three times in places, while other parts had been lined only once or twice, and some not at all. The entire original structure was intact and being used, except where slides or other mishaps had made it necessary to replace a few bents, and was continued in use until 1913, when the company quit operating.

Before leaving the subject of log flumes it will, perhaps, be proper to make some mention of the lighter, more cheaply constructed class of flumes used for the transportation of lumber, ties and other products of the forest. A flume any size from twenty-four to thirty inches high, and of much larger material throughout than that necessary for a log flume, is generally all that is required for such service, and can be built for about half the cost of the smallest practicable size of log flume. Much sharper curves are usually permissible and practicable in their construction. I have constructed flumes of this kind for as low a cost as two thousand dollars per mile, and obtained entirely satisfactory results in their operation. They can be utilized to advantage whenever the conditions will warrant having the sawmill located in the timber for carrying the rough lumber to a shipping point on a railroad. The flume can be built in such a way as to receive the lumber as it passes over the trimmer without extra handling, carry it to a yard or planing mill at the railroad shipping point, and there dump it on sorting chains, which, so far as handling is concerned, accomplishes the same result as though mill and yard were immediately adjacent to each other, and with no additional expense after the flume is constructed except the cost of its operation, which will not amount to more than a few cents per thousand feet.

There are many other purposes besides those mentioned to which flumes can be adapted as a means of transportation, where they will prove more economical and effective than any other method. Probably the reason for flumes not being in more common use is that a large majority of the people who would have the greatest interest in them as a means of transportation have never had an opportunity to become familiar with their possibilities, or the advantages to be gained in using them; consequently when a means of transportation is being considered, a flume is likely to be entirely overlooked, or, if thought of, discarded as not being feasible or of advantage. However, the interest now being shown in flume construction by loggers in general throughout the west would seem to indicate that this means of transportation will become more generally known in the near future.

Damaged Timber Flume Quickly Repaired

That the operation of a logging flume is accompanied by a certain amount of risk is shown by the accompanying illustration, which represents a broken section of the flume operated by the Slocan Valley Lumber Company, at Koch's Siding, B. C. The break in the flume occurred about midnight on May 16th last and, so far as the company are able to discover, was the result of a washout of earth upon which the trestle was placed. The amount of damage done was greatly magnified in the first reports, although, from a superficial survey immediately after the occurrence, there seemed to be a very discouraging prospect of getting the company's stock of logs flumed out before the water in the creek receded. The damage was located at Robertson Creek at a point where the flume crosses the canyon, about 60 feet below. With so much twisted lumber and broken trestle lying about in criss-cross shape at an almost inaccessible angle for the workmen to get started upon repairs, a long tie-up threatened, but as soon as scaffolding had been put into place the necessary repairs were completed within four days and sluicing was then resumed. The flume is now in first class shape and the company expect to sluice out a considerable quantity of timber, saw logs, poles and

Break in W. C. E. Koch Flume—Thought to be Result of Washout.

piling from logging operations that will be commenced early in the fall. The capacity of the intake of the flume is easily one log per second of the average run of mountain timber.

This flume was constructed by Wm. C. E. Koch and is now operated by his successors, the Slocan Valley Lumber Company, who have leased the mill for the purpose of sawing out the timber standing upon the areas from which the log flume empties, from the dam at Robertson Creek to the Slocan River, about one and one-half miles south of Slocan City.

The flume is 1¼ miles long, V shaped, with four-foot sides, 2-in. material from 6 in. up to 12 in. in width, tongued upon both edges having been utilized. Although the flume was erected some three years ago, there is little sign of wear and it has given very efficient service up to date. In some places the flume traverses very precipitous canyons. In fact the whole substructure rests upon trestling, which was adopted in place of square timber. In the construction of the flume there was consumed somewhere in the neighborhood of 250,000 feet of timber. It will capably flume sticks up to 80 feet long. Boom sticks of this length were sluiced through and used for the storage of logs at the dump-off in the Slocan River.

Jas. D. Lacey & Company, Portland, Oregon, advise us that from July 31st, the special partnership heretofore existing between Jas. D. Lacey, Wood Beal, Victor Thrane and H. D. Langille under the name of Jas. D. Lacey & Company, has been dissolved by H. D. Langille retiring. The others will continue to conduct the business under the same firm name and at the present address, 1310 North Western Bank Building, Portland, Ore.

Philip T. Coolidge, the well-known forest engineer, with offices at 31 Central Street, Bangor, Me., reports that there is a good demand for the services of forest engineers in the North Eastern States at present. During the past month he has been estimating timber on two townships in the north part of Penobscot County, Maine.

On Sunday, August 20, Mr. R. M. W. McLaren, secretary and managing director of D. K. McLaren, Limited, Montreal, died suddenly at his residence, Westmount, P.Q. He leaves a widow and two children.

Log Handling for Timber Flume

How They Are Drawn to the Skids, Loaded into the Flume and Forwarded to the Mill.

THE engineering and construction features in connection with logging flumes are discussed in considerable detail in the article by Mr. W. D. Starbird, M. Can. Soc. C. E., which is published in this issue. More complete details regarding the actual operation, and also, to some extent dealing with construction, in connection with the flume of the Adams River Lumber Company, whose sawmill is located at Chase, B. C., are given in the present article, for the information in which we are indebted to an interesting report by C. R. Mills and H. A. Parker, submitted as a part of their studies at the Department of Forestry of the University of Toronto.

The topography of the timber berths operated by this company, and its facilities for water transportation are accountable for the company having decided to erect a logging flume. The limit under operation at the time this report was prepared is about 1,000 feet higher than the mill at Chase. The whole berth slopes to a central valley, running through which is a creek emptying into Adams River. Big Shuswap Lake, a short section of the Thompson River, and Little Shuswap Lake complete the water route to the mill. On account of the smallness of the logs, comparatively speaking, horses were used for skidding, instead of donkey engines. From the stump to the flume is always down grade and pole chutes are used, four or five logs being drawn at a time by horses. Climatic conditions enable the company to conduct their logging operations throughout the year with the exception of about one month during the winter, when the snow is too deep in the bush. The flume, however, cannot be used in the winter, or for about six weeks in July and August. During these times the logs are skidded to the side of the flume, ready to be shot down when the water is available.

In the logging operations two men fell the trees, lop the branches and cut them into log lengths. Careful work is necessary in lopping the branches so as to reduce the wearing of the flume to a minimum. The logs are neither nosed nor peeled. Before the completion of the flume, skidding was confined to those areas in its immediate vicinity. The logs were skidded by horses on skidways having their head blocks within five feet of the flume. When fluming started, a couple of skids were thrown across onto the flume and two men with peavies put all the logs that were on or above the level of the flume into the water. Logs below this level were hoisted onto the skids by horses and decking line.

Chuting Logs to the Flume

The main skidway to any point consists of a three-log chute, with a road alongside for the use of horses pulling the logs, as the slope down hill was not sufficient for chuting by gravity. A team of heavy horses was used to haul four or five logs at a time. This team pulled on the rear log by means of a chain and dog, the latter being driven into the log by a light sledge hammer. The lower end of the chute meets the upper edge of the flume at an angle of about 25 degrees. The first two logs are forced into the water when the horses are drawing towards the flume. To put the remainder of the logs, except one, into the flume, the horses are turned and hitched to a wire rope passing through a stationary pulley at the flume back to the rear log, where it is fastened by a dog. A platform is built in the obtuse angle between the chute and the flume for the use of the horses. Two men are employed at the end of the chute, the teamster and a man to look after the dogs.

Skidways were built beside the flume. In the construction of a skidway, a head block consisting usually of the butt of some large tree which has been cut off because of its punk heart, is placed on the ground parallel to the direction in which the skidded logs are to lie. Two notches, the distance apart depending upon the length of the logs to be skidded, are cut in it to receive the front ends of the two skids. For skids are chosen two large trees, 8 or 10 inches in diameter at the base, and which carry this diameter well up. They must be strong, and as they are usually left on the ground after the logs are removed, are preferrably of a species which is of little use for saw timber. These are placed at right angles to the head block projecting over it by not more than a foot, and with their small ends away from the flume. Should there be a bend in the skid, the convex side is always placed upwards. Unless the number of logs to be placed on a skid is very small, a support is placed under each skid. If a suitable non-merchantable log can be found it is used, or if not a crib work is built up. The number of logs on a skidway varies, sometimes running as high as 125 to 130.

Whenever possible, in the construction of the flume, sections were

put together at the mill where the timber was sawn. Each section which forms the frame work for the V has a sill of sufficient length to reach across the stringers and project far enough on one side to support a plank walk. The V to which 2-in. plank are nailed is supported by two beams, one on either side. Where trestle is necessary it is built of unsawn timber. The largest trestle is about 75 feet high and 500 yards long. In several places the flume runs through cuts in small ridges, thus cutting off the small turns of the creek bed.

The trough of the flume is of two-inch plank, rising at an angle of 45 degrees to a height of four feet. Care is taken that there are no rough joints in the planking which would hold up a log and cause a jam. The cracks between the planks are battened with 3 in. x 1 in. strips. The plank walk extends along the side for the use of the men on guard to prevent jams during the fluming. The grade of the flume varies from 2 to 25 per cent. On the 25 per cent. grade, the water runs at such speed that the depth is greatly decreased. To overcome this, a feed enters just above. It is built with flat bottom and vertical sides, of dressed inch lumber, held in place by 2 in. x 4 in. scantling. At the upper end of the main flume the flow of water is controlled by a dam constructed of rough timber, stone, earth, and plank. Two sluice ways control the supply of water in the flume. Each guard has about a mile of flume to watch, and has near at hand a telephone connected with the skidways and main camp.

The logs after leaving the flume are left to float down the Adams River to Shuswap Lake of their own accord. Here they are caught in a boom, held around the mouth of the river by piling. The boom is fastened together by ring-dogs and chains. From here they are towed in bag booms by a stern-wheel steamer, or an alligator, across the end of the lake, down the short section of the Thompson River to Little Shuswap Lake, and through it to the mill at Chase. There are usually six in the boat crew; captain, engineer, fireman, two deck hands, and a cook. The boom is attached to the bow of the boat, the boat travelling stern foremost. These boats are also used for gathering up stray logs along the shore of the lake. To gather these the logs are rolled into the water by hand or with the help of horses. The boat is furnished with a boom, one end of which is fastened to it, while the other is held at some distance shoreward from it by means of projecting beams. As this passes along, the logs are caught in its open mouth. Wood, birch and fir chiefly, is used as fuel for the engines in the boats.

Progressive Methods in Northern Ontario

Spanish River Lumber Company's Operations—Supplies Hauled by Motor Truck —Model Headquarters at Massey

RANKING among the oldest and largest commercial enterprises of the North Shore, is that of the Spanish River Lumber Company, Limited,with head office at the town of Massey, Ont., and the Soo Branch of the Canadian Pacific Railway and about eighteen miles east of the Georgian Bay. The town is situated on the north bank of the Spanish River at its confluence with the Sable River.

The company have operated from this point for about thirty-five years, but in 1904 their affairs passed into the hands of the present owners and from that date their operations have constantly expanded until at the present date they are among the largest operators in the province.

The company control an area of timber lands considerably in excess of one thousand square miles, and operate from eight to fourteen lumber camps annually, in addition to a number of small jobbers, so that their annual production runs into several hundred thousands of logs, consisting mainly of white and Norway pine.

The Spanish River Lumber Company own two large mills, situated at Aird Island, in the Georgian Bay, and at the village of Cutler, on the Soo branch, the two mills being capable of taking care of all the raw material produced in the company's limits. The product of the Aird Island mill is shipped entirely by water, but the mill at Cutler has both lake and rail shipping facilities. Until a few years ago the company sold their product exclusively to the wholesale trade in United States centres, but four or five years ago they established a large wholesale and retail yard at Sarnia, Ont., under the superintendence of Mr. Harry Turnbull, and from this point they entered the retail market of western Ontario. At this yard is maintained a large and well assorted stock of white and red pine, hemlock and spruce lumber, together with lath, pickets, cedar posts and British Columbia cedar shingles.

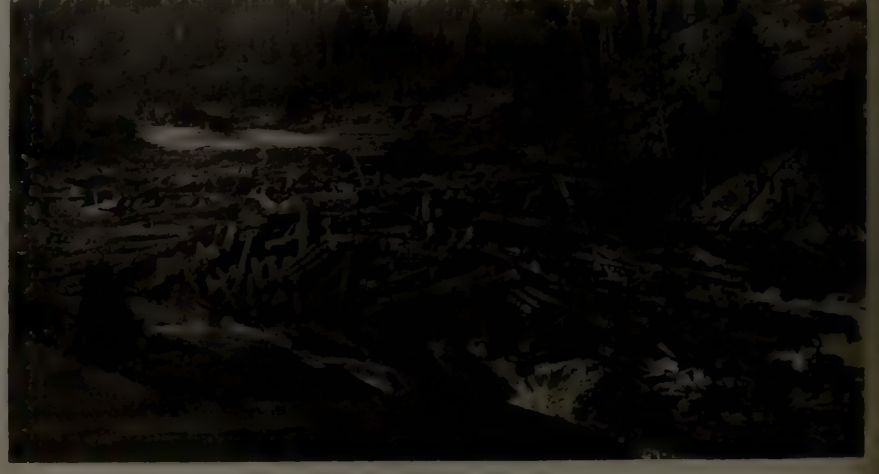
The company's mill at Cutler was built in 1915, the old mill having been destroyed by fire in the spring of that year. A unique feature of the Cutler mill is that the entire foundation is constructed of concrete. This feature, together with the fact of the mill being equipped exclusively with band saws, makes it probably the most modern and up-to-date plant on the North Shore.

Special Road Built for Supply Truck

Obtaining large new limits in the Nipissing forest reserve on and near Sable Lake, which forms the head water of the Sable River, the Company commenced the construction of a road from Massey to Ritchie Falls depot (the distributing point for the new limits) a distance approximately of fifty miles, and by the time the operating season of 1915 opened, they had completed about twenty miles of the road to an extent that admitted of the use of a three-ton Packard motor truck in the transportation of lumbering supplies; an innovation in saw-logging operations that must be admitted as being sufficiently modern to make uneasy the rest of the departed lumber jacks of the old school.

The truck operated by the company is a three-ton Packard, 1915 model. Last summer and fall they forwarded supplies north of Massey with this truck, making an average of 75 miles per day with a full load and doing the work of nine pairs of horses and wagons. Their

Spanish River Lumber Company's Three Ton Packard Taking Supplies to Camp.



A Log Jam on the Sauble River, Near Massey, Ont.

tote road has now been completed and put in shape for truck or automobile traffic for a distance of 30 miles north from Massey. They still have about thirty miles to finish, which may not be completed until next year, on account of the present scarcity of labor. The illustration shows the truck on one of its trips loaded to capacity with three tons and 500 lbs. of sacked oats. The road was constructed at a cost of $500 per mile.

In connection with these limits the company constructed a very large reserve dam on the Sable River at Ritchie Falls depot, which carries a head of from seventeen to twenty feet of water, Sable Lake is five miles distant from the dam, and the lake, having a very large natural area, it is not difficult to understand that such a thing as a stuck drive on the Sable River from drought, does not enter into the company's calculations.

Another large limit is situated on the North Shore of the Georgian Bay, about twenty-five miles northeast of Little Current. The operations there are carried on under the local superintendence of Mr. Henry Bell, with headquarters on the limits at a point known as Bay Finn. An exceptionally fine quality of pine is obtained from this limit which is about ninety square miles in extent.

Other operations of the company are conducted from Cartier on the main line of the C. P. R., the logs watering in the main Spanish River. Also at Thor Lake, on the main line of the Canadian Northern Railway, about sixty miles north of Sudbury, the logs reaching the Georgian Bay through the upper reaches of the Wahnapitae River.

The disastrous wind storm of 1914 which laid low so many millions of feet of valuable timber throughout northern Ontario, affected the company to a considerable extent, but until the present season the company have been most fortunate with respect to forest fires, when the extent and exposed position of some of their limits is taken into consideration. This season, however, the almost universal forest fires entered their district and caused considerable loss, both of timber and river improvements. A little adversity, however, only seems to let loose reserve energy, and if the opposition of the elements has in any way upset the plans of the company, it is not discernible to the onlooker, and causes no interruption to the regular routine.

Naturally, the company employ a very large and varied number of employees, of almost every conceivable capacity, and their monthly pay-roll forms an item in dollars and cents big enough to make any reasonable person sit up and take a little notice. Needless to say, their operations are of large importance to the district lying between Sudbury and Sault Ste. Marie.

The company mills at Aird Island and Cutler have always been under the superintendence of Mr. J. O. Smith, of Bay City, Mich., a gentleman of so genial a disposition that he is hail fellow, well met, wherever he happens to put in an appearance. Unfortunately, he is at present on sick leave, but if numerous good wishes are of any avail, he will soon resume his activities. During his absence the supervision is in the hands of Mr. A. J. McDonell, the secretary-treasurer of the Spanish Mills Company.

There are considerable quantities of valuable hardwoods on the company's limits that have not yet been dealt with, but it is quite within the probabilities that at some suitable future date hardwood production will be added to the company's activities.

Headquarters at Massey, Ont.

At Massey, the company occupy quite a large plant, consisting of general offices, warehouses, barns, boarding houses, etc., and close to the town on the bank of the Sable River are several large feed barns, each one hundred by thirty feet, in which the company spring out their horses between seasons. In connection their is also a chopping mill, in which all hay, oats, etc., are cut up and then steamed in bins by means of piping from the mill boiler. The prepared fodder is then carried to the barns by means of an overhead carrier in a large steel bucket, and it is interesting to note how quickly a couple of hundred horses are fed, and with how little waste. The location of the premises are ideal. They are bounded on the south by the Spanish River, and on the west by the Sable, the horses having a matter of about one hundred acres of land in which to exercise, part of which contains a considerable number of trees that offer excellent shade.

The extensive operations of the company are managed by Mr. B. W. Arnold, of Albany, N.Y., who is the president of the company, with a branch office in that city. Mr. Arnold has very large interests in his native city and at other points, but finds time to visit his Canadian interests regularly. Mr. W. J. Bell, of Sudbury, who is the vice-president and general manager, devotes a large part of his busy life to the management of the company affairs, and is ably supported by the general superintendent, Mr. J. A. Ferguson, of Massey, who controls the entire woods operations and many other interests of the company from the headquarters at Massey. Mr. Ferguson hails from Renfrew, and is a typical example of that Scottish-Canadian race who, since the first days of the Hudson Bay Company, have ever been conspicuous in the first ranks of the political and commercial life of Canada.

How to Build a Camp Fire

Most lumbermen know how to build a camp fire and how to put it out when they have finished with it. It is often the expert swimmer, however, who gets drowned, and by the same line of thought we do not need to apologize for reproducing the following instructions about handling camp fires, published by the U. S. Forest Service.

There are several varieties of camp fires, most of them simple and effective and easily constructed even by a novice in camping. There must be considered not only the kind of camp fire which gives the best service but the kind which is least dangerous. The man who is careless with his camp fire should not be allowed in the woods, for all too frequently he is responsible for forest fires which do tremendous damage.

Camp stoves should be taken whenever they can be transported. They are safer than open fires, more convenient, require less fuel, and do not blacken the cooking utensils. Collapsible sheet-iron stoves may be obtained.

In the absence of a stove an open fire must be built. A safe and serviceable fireplace can be made of rocks placed in a small circle so as to support the utensils. Where rocks are not obtainable, poles may be used.

For permanent camps it pays to build a stone fireplace. A piece of sheet iron will prevent the blackening of the pans and makes a better draft.

For temporary camps the fire should be built as follows:—

Dig a hole about a foot deep and about three or four feet in diameter. Shovel away the side toward the wind. Lay green poles across the hole to support the pots and pans, and build the fire underneath.

Fire irons are often a great convenience. A piece of three-eighths-inch round iron four feet long is bent at right angles a foot from each end and the ends are sharpened. Two of these irons are placed side by side, the ends are driven into the ground and the fire kindled beneath them. Instead of being made in one piece, the pegs and crossbars may be connected by rings in the ends. They will then fold and be easier to pack.

Camp fires should never be larger than necessary, and the utmost care should be taken to prevent sparks from being carried into the neighboring forest. Clear away the litter for a considerable space about the fire. And be sure to put the fire out before you leave it.

A shovel is nearly as important a tool as an axe in camping. Do not count on finding one along the way, but put one in your outfit.

During wet weather look for kindling in burned pine butts or in pine knots. The under side of a leaning tree will usually contain dry material. Dead branches that have not yet fallen are drier than those on the ground. Bark from fir snags is excellent fuel.

Where matches are scarce or when the weather is stormy, first light a candle and kindle your fire from that.

Hints on fire protection are always timely and fit particularly well with these instructions about camp fires.

The first thing is prevention. Be particularly careful with camp fire, matches, and tobacco.

Scrape all inflammable material from around the fire before lighting it. Make a fireplace either by digging a hole or by poling up rocks. The fire will then not only be safer, but will draw better.

Before leaving camp see that the last spark is extinguished. Pour water on the embers and then cover them with earth.

Don't make your fire too large. Large fires are not as convenient to cook by as small ones and are more trouble to put out.

If you discover a fire, go to it at once and put it out if you can. A small fire can be put out easily by throwing handfuls of earth, sand, or dust at the base of the flame. The flames may also be beaten down with sacks or with branches, but care must be taken not to scatter the fire.

If the fire is spreading too rapidly to be attacked directly, cut and scrape a trail some distance ahead of it. Do not back-fire; this is work for an experienced man. If a fire is serious enough to require this treatment, the work should be left to a ranger.

The best tools for fire fighting are the shovel, axe, and hoe or rake. In open pine forest very little axe work will be required. Shovel or rake a trail through the needles down to mineral soil, and guard the trail.

To stop a fire burning in brush the trail must first be cut with the axe and then scraped. The brush should be thrown to the side away from the fire. The litter may be scraped toward the fire.

Pick a route for the fire trail that will avoid brush patches if possible. The crest of a ridge is an excellent location, since the fire naturally checks at the top.

Do not give up because the fire is gaining headway or because you lack tools. The fire has probably already been reported by lookouts, and rangers hurrying to it properly equipped. Stay and help them; and in the meantime do what you can to keep it in check.

See that a fire is cold before you leave it.

Forest Telephones and Fire Protection

Immediate Communication All-important in Preventing Conflagrations—Recent Developments that Make Effective Work Possible

By W. N. Millar*

Government officer describes methods worked out on forest reserves which are bringing good results and are applicable in large measure to privately owned timber holdings.

FOR the improvement of fire protection on the Dominion Forest Reserves, the Forestry Branch of the Department of the Interior has, during the past four years, followed out a policy of gradual extension of telephone lines into the large reserves under its charge in the four western provinces. The total mileage thus constructed is at present about 710 miles, distributed approximately as follows:—

British Columbia Reserves	75 miles.
Alberta Reserves	265 miles
Saskatchewan Reserves	50 miles
Manitoba Reserves	320 miles
Total	710 miles

Compared with the 320,000 miles of forest telephone lines constructed by the United States Forest Service on the National Forests during the past eight years, this is, of course, only a small beginning, but the intention is to enlarge the work of telephone construction as rapidly as proper experience and skill are secured in the work, and as funds permit. In line with this intention the Forestry Branch inaugurated during the present field season a systematic course of instruction in certain specific phases of telephone work. Four meetings were held which were attended by some sixty forest rangers and supervisors of the permanent field staff in Alberta and Saskatchewan. Each meeting lasted from six to eight days, and the entire time was devoted to lectures on the special types of telephone equipment used on forest protection lines, illustrated by samples of the equipment itself, and to practical work of line construction and the installation and operation of equipment. All the meetings were held on, or immediately adjacent to forest reserves, where it was possible to build a demonstration line under normal average field conditions, using the regular standard equipment and methods prescribed by the Forestry Branch. This work was under the charge of the writer, who, in addition to a theoretical knowledge of telephony has had eight years of practical experience in the construction of hundreds of miles of forest telephone lines, beginning with the first lines of this character built by the United States Forest Service in Northern Idaho in 1908.

Special Line Construction Required

It is not, perhaps, generally realized that the type of line constructon adapted to forest protection purposes has, in the past five years, become very thoroughly specialized and that it differs materially from the ordinary methods of rural and commercial construction. This specialization is rendered necessary by the fact that many forest protection lines must, for reasons of economy, be built through heavy timber without clearing the wide right-of-way demanded in commercial construction. Of course, where a suitable open right-of-way is available construction methods and specifications are similar to those employed on ordinary rural lines, but this is the exception rather than the rule.

Briefly described, forest protection telephone systems consist of grounded lines built of number 9 B.W.G. galvanized iron wire hung on trees instead of poles, and using a special split tree insulator instead of the usual well-known type of glass insulator employed on poles. To prevent damage from falling timber and swaying trees, certain rules of construction must be very carefully observed. These provide for a careful equalization of spans, for the leaving of a very large amount of slack, for the placing of ties on the concave side of all curves, for the staggering of supports out of a straight line, and for the employment of special methods of attaching the insulators to the trees so devised that when an excessive strain comes on the line wire, as through the fall of a tree the wire will be detached from the support and carried to the ground, but will not break. The whole construction aims to produce a line that, while resisting all ordinary strains, yields at once to excessive strain in such a way as to insure absolutely against line breakage. In this it differs radically from the well-known methods employed in ordinary commercial practice, which produces a line of extreme rigidity because the open right-of-way insures against the danger of falling timber to which the forest line is constantly exposed.

* General Inspecfor of Dominion Forest Reserves.

The instruments used are the most powerful types of magneto sets employing local batteries and code ringing. Such a set is the 1317-S set of the Northern Electric Company, equipped with a 2500 ohm, unbiased ringer and a .5 microfarad condenser wired in series in the receiver circuit. With these sets and a well constructed line it is possible to get good service over about 125 miles of No. 9 wire, to which from 20 to 25 such instruments have been attached. For installation on lookout peaks and other exposed sites, a special armored mine telephone is employed, while for temporary camps a light self-contained ten pound set has been specially devised.

Perhaps the most cleverly designed of all the equipment, however, is the aluminum pocket telephone, weighing only two pounds, which is used by the rangers for getting into communication with headquarters from any place along the telephone line in the forest. This is a new type invented by R. B. Adams, of the U. S. Forest Service, and fills a long felt want for a thoroughly practical long distance telephone, that at the same time would be so light as to form only an inconsiderable addition to a ranger's pack while on patrol.

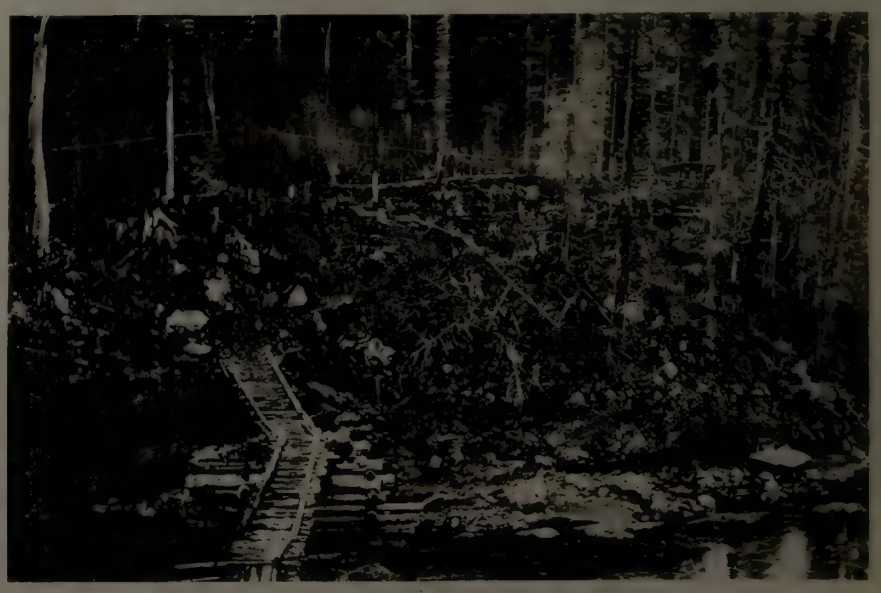
Cost of Construction and Maintenance

The cost of telephone construction and maintenance is naturally an element of great importance in forest protection for such lines almost never serve any other purpose unless used in connection with a logging operation, and, of course, produce no direct revenue. As already indicated, the special tree line methods and equipment evolved from the experience of the past eight to ten years are all aimed at the production of a line having a low initial cost and a high degree of dependability with a maintenance problem adapted to the lines' peculiar conditions of employment. Four distinct cost elements enter into an estimate for a forest telephone line. These are materials, transportation, line clearing and wire stringing.

Present material prices are so abnormal that little construction is now being attempted, but under ordinary conditions the per mile cost of line materials lies between $9 and $12, according to freight rates from nearest market. Of this, only about $2 to $3 is for insulators and ties, the rest being for line wire. The equipment for each station costs from $15 to $18.

Transportation covers the distribution of materials along the line and camp moving. It naturally depends on the distance involved and the facilities available. Four hundred pounds of material per mile of line must be delivered. In any ordinary case it is a small element in the total cost.

Line clearing is often a large element and always a variable one, as it depends entirely on the character of the timber through which the line is built. Of course, only a very narrow clearing is required, 6 to 8 feet as a rule, and often a road or trail is already available. The



A typical B.C. Forest trail, passing through a clearing, with telephone line on left.

cost will vary from $2 up to $25 per mile, but a good average figure is $10 per mile.

Wire stringing with experienced men under proper supervision is a minor element of the cost. It will run from $4 to $8 per mile, but tremendous difficulties have been met in the Forestry Branch work in securing qualified men for this work. Ordinary linemen have nearily always proven wholly unfitted for forest line construction, because, no matter how skilful in their own particular methods, they lack the intelligence required to adapt their skill to the peculiar methods of tree construction, and nearly always use the pole line methods to which they are accustomed, with disastrous results to the forest line. It was this difficulty experienced in securing men skilled in tree line methods that caused the Forestry Branch to adopt the plan of providing special facilities for the training of its own men in these methods of line work.

Given normal prices for material, a line starting at a railroad, standing green timber through which to build, and proper skill in construction and supervision, a first class tree line can be built as low as $25 per mile, but will usually run from $35 to $45 per mile. Where the haul is longer or where supplies must be packed on horses and especially where dead timber or heavy underbrush is encountered, this cost may be increased to from $50 to $65 per mile. Station equipment and line construction tools are, of course, additional. The latter cost about $100 for a crew and last for many years.

Maintenance on a properly constructed tree line is very low unless the line runs for a long distance through standing dead timber. Ordinarily an annual or semi-annual overhauling at a cost of not more than $1 per mile is sufficient, in addition to requiring patrolmen to repair all injuries to the line in their district as they occur. In green timber these are inconsiderable, but in dead timber where trees are constantly falling, at least one man day per month to each 15 miles of line for maintenance work should be planned for. Of course, nearly all forest telephone line maintenance is carried on in connection with fire patrol, from which it is difficult to separate it, in a cost record. Such lines have a life of from fifteen to twenty years.

How the Telephone is Used

A brief description of how the telephone is utilized as an aid in forest protection may be of interest. It is quite obvious that the instantaneous communication which a telephone makes possible, regardless of the distance involved, renders possible the rapid summoning of assistance by a fire ranger in a remote section of the forest, and thus the control of fires that might otherwise grow to uncontrollable proportions. Also, it is equally obvious that where, as in all but the most primitive of fire ranging services, there is a separation of the field force into an executive and an administative staff, it is possible by means of the telephone to link up the supervising officer with his subordinates and thus provide for coordination of the work of the rangers over a large district and for mutual assistance under the direction of a central intelligence. This is about as far as any fire ranging service in Canada has as yet carried the utilization of the telephone in forest protection, while it is unfortunately true that some of the very largest and most costly of all, notably the fire ranging service of Ontario, make no use of the telephone whatever, but depend on the individual, unaided and undirected efforts of a large untrained staff, with what results the recent fires in the north have shown. As a matter of fact, however, only the outer fringe of the possibilities of the utilization of the telephone in forest protection has been touched when it is used only to the extent above indicated.

Forest protection in recent years has taken enormous strides in America, and it has been realized at last that the problem of preventing forests from burning up under the conditions existing in America is every bit as difficult and involved a technical and administrative problem as is, for instance, the operation of a lumber business or any large commercial undertaking. The result has been the development of what is known as specialized forest protection and a special class of trained experts in the art of protecting forests from fire. Two fundamental problems present themselves. The one is the prevention of fires. The other is the suppression of those not prevented. Since nearly all fires are due to human agencies, fire prevention is of very great importance, but it is, on the whole, largely a problem for the advertiser, and the forest telephone has only an indirect relation to prevention work.

Fire suppression, however, is a wholly different problem, and one which, despite all prevention efforts that may reasonably be anticipated, we may confidently expect to face for many years to come. Northern fire suppression methods are based upon a very simple and very obvious fact, namely, that every very large fire was once a very small fire, and that the one sure way to prevent the large destructive fire from occurring is to put all fires out when they are small. There are only two ways by which this may be accomplished. The one is to employ an overwhelming force of men during the fire season, distribute them over the forested area and depend upon a very intensive patrol to locate and extinguish all fires in their incipiency. This method has the merit of simplicity, at least. No special training or qualifications are required in the personnel. No elaborate organization or inspection is necessary, and very many jobs are made available. Accordingly, this system has been very much favored by certain governmental fire ranging bureaus, which saw in the comparative obscurity of the fire rangers' work a chance to reward many lesser party workers at public expense without the fact being too glaringly conspicuous.

Ontario's Extravagance and Failure

So, in Ontario, for instance, there has grown up what it will surprise most persons to learn is the largest fire ranging staff in the Western Hemisphere, a staff consisting all told of more than 1,000 men, whose sole duty is fire protection. Of course, fire protection can be secured by this means, but only at enormous expense, and expense commensurate in fact with what would be required to protect our cities from fire according to modern requirements, but employing only the old-time bucket brigade. Such an expense is wholly impracticable over any large timber area, and so we have, even in Ontario, with its strikingly high per acre expenditure for fire protection, a constant and widespread destruction of forests occurring, year after year, throughout the north, but brought to general public notice only at irregular periods when by chance one of these large fires happens to involve a village or town as in Porcupine in 1911, or again during the present season at Matheson and Cochrane. Of course, under this system forest telephone lines are not utilized because each ranger acts for himself independently of all others. There is only a rudimentary development of direction by a central intelligence, and there is therefore no need for direct and speedy means of intercommunication between the various elements of the fire ranging staff.

The modern method of specialized forest fire protection operates on a wholly different plan which would be entirely impracticable were it not for the telephone. There is nothing mysterious about these methods, however. They are, in fact, nothing more or less than the application to forest protection of the same factors that have produced our modern industrial development, namely, specialization of function, training of workers and the use of mechanical aids to increase human effectiveness.

Obviously three things must be provided for if all fires are to be extinguished in their incipiency.

They must first be discovered while they are still in the controllable stage.

They must then be reached by a force of men of sufficient numbers and properly equipped to put them out.

They must finally be put out by this force and that so thoroughly that all danger of recurrence is rendered impossible.

How the Staff Co-operates

The modern forest protection staff accomplishes these things in the following manner:

Fires are discovered and their exact location determined by a special corps of lookouts who have no other function to perform. These lookouts are placed on commanding peaks or towers where they remain continuously during the daylight hours throughout the fire season. Each is provided with a special lookout map of his district, with a fire locating device and with a telephone connecting him with a central headquarters at which all lookout reports are received and where the actual work of determining the precise location of fires is done. A large amount of special equipment has been invented in recent years to facilitate the rapid and precise location of fires from such lookout peaks, so that now in certain large forest areas of the western states, it is a matter of minutes only from the time a fire starts until it is detected and accurately located by a lookout. The vital necessity for telephone communication at the lookout station is evident, for obviously, since the lookout merely locates fires and does not extinguish them, he would be useless without some means of conveying his information to some other agency. Many factors enter into the problem of the number of lookouts required, but as a rule each covers an area roughly approximating a circle thirty miles in diameter.

Once the fire is exactly located, however, and this information conveyed to a central headquarters, the next obvious step is to dispatch a force for its suppression. Since an intensive lookout's equipment should discover all fires while they are still incipient, this force need not be larger than one man. This man must, however, be immediately available at all times, and must be both capable of reaching the fire and equipped to attack and control it when he does reach it. These requirements are best met by a strong active woodsman, thoroughly acquainted with his own district, who is kept permanently stationed at some centrally located point in this district and connected by telephone with the center's fire central headquarters for the entire region. Such a unit is called a "smoke chaser," and immediately when the discovery of a fire in any district, the "smoke chaser" for that district is to go immediately to the fire and put it out. In doing this he also has various aids. Improved routes of travel, such as trails or roads through his district are of prime importance. Means

of transportation adapted to the country are obviously necessary and may vary all the way from his own two legs to a motor car. Special tools for fire fighting, light camp outfits and the new light telephone are part of a "smoke chaser's" equipment. Everything possible in the way of permanent improvements and mechanical equipment is furnished to this smoke chaser with the one object of assisting him to get to the fire with the least possible delay and be able to make the best possible fight against it when he arrives.

Emergency Safeguards

Finally, there is the question of providing supports and reserves so as to be safe against any emergency. Even though the lookouts and smoke chasers successfully discover and extinguish 99 out of every 100 fires, there is always the chance that that odd hundredth fire which some unforeseen slip in the fire fighting machine has allowed to escape, will do a large amount of damage. Therefore, it is necessary to organize the entire available labor force of the local community so that it may be relied upon to act as a reserve fire fighting force in case the regular staff is unable to cope with the situation. In this, the telephone is an invaluable assistance, making possible as it does immediate communication with all sources of extra labor and rendering feasible the summoning of such labor to the points where an emergency threatens to develop.

To some, the system above outlined may appear somewhat complicated or even fanciful. As a matter of fact, this system is to-day actually in operation over timber lands in the United States bearing at least double the total timber stand of all Canada. In these forests a fire that covers a couple of hundred acres is now considered a disaster and an immediate investigation to determine the cause of the breakdown in the system is begun. Compare this with the recent fire in the north, where at least 750,000 acres were involved in one fire, and it is only one of hundreds, noticed only because it involved a few villages and destroyed many lives, while the others destroyed only one of the vital resources of the province, and being remote from the railroad can be easily concealed.

Finally, abundant figures are available to prove that this system is not only efficient but cheap. Every business man appreciates the fact that labor-saving machinery is cheaper than human labor, and that although skilled employees draw higher pay than unskilled, this pay is very far from representing the increased efficiency of the skilled over the unskilled man. Specialized fire protection is made cheap by using labor-saving machinery and skilled men for the very same reason that factory made products are cheaper than hand made, but specialized fire protection and political patronage methods of employing rangers are two things that are wholly incompatible in actual practice. The proof is simple. The combination simply does not exist.

The Telephone in B.C. Logging Camps

By J. D. Gilmour

Speedy and reliable means of communication is one of the necessities in fire protection; it is also very desirable in the logging business. In some places on the coast of British Columbia and in some of the heavily timbered valleys of the interior, there is no likelihood of commercial telephone lines being built for many years. Until recent times many logging camps were situated in such locations, without any means of communication with the outside world except an infrequent mail service, or in case of emergency long trips had to be made by launch or trail. Conditions, however, are gradually being changed, and now many logging camps previously without direct connection are linked up by Forest Branch telephone lines.

Such lines are not only a great convenience to the logger, but are of inestimable advantage to the Forest Branch during the fire season. There is considerable fire risk inherent in the logging business, not only on account of the hazard created by the crew, but hazards due to steam logging with donkeys and locomotives. In many parts of the province logging camps are the only available men for fire fighting and by means of the telephone may be summoned quickly from the nearest camps to the scene of the fire. The fire season of 1915 on the Coast was the first bad season since the telephone line to the Coast logging camps was constructed, and its worth was conclusively demonstrated many times.

Outside the fire season a system of co-operation in maintenance of such telephone lines has worked satisfactorily, the loggers being willing to contribute part of the cost during the winter months. During the summer the Forest Branch bears the whole cost of maintenance.

Existing commercial lines are used wherever possible, and the Forest Branch lines are nearly all connected to other lines belonging to the Dominion Government and private companies. Precedence is given to messages regarding fire by all operators. Ranchers are glad to become voluntary members of the fire protection force, and report any fires starting in their neighborhood, in return for connection with the Forest Branch lines. Such instruments are free to the public, toll charges being collected only by the connecting commercial lines over which the message may have to be transmitted. In the districts served by the telephone lines prompt and reliable information about fires is quickly obtainable through the co-operation of the public.

On the Coast, six submarine cables have been laid—a total distance of 18,450 feet. These all cross deep channels, subject to strong tidal influence. The shore end of one of these cables is shown in one of the accompanying illustrations. All of them have given good service without any trouble.

The land lines are hung on trees, by means of the Thomas split tree insulator, with an oak bracket on each seventh tree. In a few sections poles had to be erected, and brackets used throughout. Tree lines should not be too high, or excessive swaying of the tree affects them, They require plenty of slack so that falling trees will bear the line to the ground without breaking it.

The standard main line wire is No. 9 B.W. gauge, galvanized iron, but No. 12 B.W.G. will serve for branches up to twenty miles in length. The standard instrument for inside use is the wall telephone set. For outside use an iron set is used. Repeating coils used to connect a ground circuit with the metallic circuit of commercial lines, have given good satisfaction.

The following lines have been built in the last four seasons by the B. C. Forest Branch:—Hazelton to Suskwa River, 20 miles, Terrace to Lakelse Lake, 17 miles, Gowland Harbour to Green Point Rapids (and branches) 68 miles, Princeton to Five Mile Creek 20 miles, Kelowna to White Mountain lookout station 12 miles, Vernon to BX lookout station 18 miles, Grand Forks to N. Forks Kettle River 44 miles, Erie to Second Relief Mine 14 miles, Arrow Park to Mosquito Creek 7 miles, Lardo to Duncan River 40 miles, Revelstoke to Big Bend, 120 miles, Creston to Goat Mountain lookout station 3 miles, Cranbrook to Baker Mountain lookout station 7 miles, Canoe Falls to White River 20 miles, Natal to Upper Elk River 60 miles; total 470 miles..

80,000 Miles Travelled by 60 Rangers

How much ground well-disciplined forest rangers can patrol is shown by the record of the Lower Ottawa Forest Protective Association. During 39 days, between April 20 and the end of May, 1916, the sixty rangers employed by the Association covered 21,678 miles of trails and highways, along all of which distance they maintained a vigilant lookout for fires, and performed numerous other duties. This works out to an average of about ten miles per day of climbing along difficult tracks through forest country and must be considered an excellent performance. The rangers, of course, were far from being continuously on patrol, as in the 39 days they issued 350 permits to settlers for slash burning and built trails, repaired 'phone wires, etc. Last year the Lower Ottawa rangers travelled 80,000 miles.

The fires encountered through April and May were ten in number, of which six were ascribed to railways, and one each to settlers, hunters, fishermen, and a sawmill.

From the Canada Lumberman of Thirty-five Years Ago

Toronto, June 1st, 1881.—Large quantities of square timber are coming down the Nipissing Railway. Between the Northern Elevator and Queen's Wharf five firms have their men at work forming the timber received per Northern, and Toronto, Grey and Bruce Railways into rafts. The following is the business here of only one of these, and the others being pretty much on a par with it the total trade may be judged according to information supplied by the foreman:—They will send off five rafts altogether this season, all for the Quebec market. The timber to be used consists of 150,000 feet of rock elm and 15,000 feet of white pine, per the T. G., and Bruce. The Northern brings down for the same firm 30,000 feet of white oak, 15,000 feet of red oak, 250,000 feet of white pine, 45,000 feet of ash, 500 traverses and 300 floats of tamarack, and about $1,000 worth of withes are used in binding these rafts. The foreman referred to says that the past year has been an extremely good year for the timber trade, plenty of snow in the bush for hauling, and enough water by the spring thaws to float the logs down the rivers to the shipping point. The men in his employ are thirty-five in number, and are all English-Canadians, with the exception of twelve, who are Frenchmen. The figures mentioned above are those of the whole season's business of the firm; as yet only a comparatively small quantity of timber has been received. So far the Northern Railway freight office officials report that no timber has as yet come down from Collingwood or Muskoka, 123,000 feet of white pine and 73,308 feet of hardwood comprising the total consignments of timber received; this is all from stations along the line between Toronto and Collingwood.

Northern Ontario Forest Destruction

Situation Demands Practical Protection — Problem a Simple One Based on Co-operation—Ontario Government's Duty

By R O. Sweezey, M. Can. Soc C.E.

THE manifestly urgent necessity for the enactment of a new and sensible forest fire protection act by the Province of Ontario, has been so persistently and convincingly shouted from the house tops by Mr. Robson Black, the energetic Secretary of the Canadian Forestry Association, that most right thinking people realized the seriousness of the situation some time ago. Now, however, since the great conflagration in northern Ontario, even the stupid may understand what Mr. Black meant when he drew pictures with uncanny accuracy, forecasting the fate that awaited Boards of Trade, etc., what pitiful reading today in the light of those the north country. And all those petitions from municipal councils, terrible and recent events they so nervously sought to forestall.

The cause of the great northern Ontario fire was settlers' fires. The cause of these fires was the lack of laws governing same, because the Provincial Government has always been afraid to offend settlers and thus lose votes. Were these pioneer settlers composed of people experienced in bush life it would have been comparatively easy to educate them as to the terrible dangers. But they came, most of them, from parts where there has been no knowledge of bush fires. Many of them cannot handle an axe when they come to the north. Others come from foreign lands and know even less of pioneer conditions. Did the Government try to warn them? Was anything done to avoid or forestall recklessness even after the great Poreupine fire of 1911 had swept through the country? Well, if any efficient measures were taken they have not been heard of by the writer, after years of experience throughout the entire north region.

Incredible as it is, one is almost forced to believe that the policy has been one which was recently spluttered in some prattling nonsense by a Toronto daily, advancing with Teutonic logic some sophistical theory that it is better to burn the northern forest anyway.

Nothing further need be written descriptive of the losses and damages of the fire except merely to state that hundreds of square miles have been burnt, with freakish pranks selecting a section here and avoiding another there.

The problem facing us is to prevent the recurrence of such discouraging losses, to save the forest for economic development and to clear the land in such manner as to derive the greatest benefit for all. With this end in view, no doubt the Ontario Government is already preparing a new Act. But will it be of the right kind? Will it be prepared by lawyers and arm-chair experts or will the advice of experienced woodsmen be sought? Then perhaps the fear of spending a dollar to save a million may be a ruling influence.

Timber Owners Have Shown the Way

May we therefore, in view of these forebodings, commend to the attention of the Government such efficient fire protective organizations as the St. Maurice Valley and Lower Ottawa systems. Or may not attention be directed to the efforts for protecting the large timber areas of Mr. M. J. O'Brien in the Upper Ottawa and the extensive limits of the Mattagami Pulp & Paper Company in northern Ontario. As several interesting papers have already been published concerning the first two, attention may now be directed to the success attending the systems of protection for the O'Brien and the Mattagami Company limits.

In 1914 Mr. M. O'Brien, realizing the importance of proper protection, tried to secure the co-operation of adjoining limit owners in establishing up-to-date methods. Failing in this because old haphazard methods seemed too deeply rooted with many of his neighbors, Mr. O'Brien inaugurated a system that has proven most efficient in protecting not only his own areas, but necessarily much adjoining property where, time and again, small fires have been detected and extinguished before they got fairly started.

Fires Nipped in the Bud

When a small fire starts from any of the several causes, the elaborate system of look-out stations and well-kept trails enables the fire rangers to spot it before it gains headway. Heliograph signals by day and powerful flash lanterns by night permit of constant communication with all look-out stations commanding a detail view of over 2,000 square miles of territory. These heliograph and lantern equipments,, with binoculars cost about $180 per main station. For the sub-stations the equipment costs only $40 or $50. About ten main stations operate an area of over 2,000 square miles. Telephone connections from one or more of the main stations to the nearest telegraph office enables head office in Montreal or elsewhere to get daily reports of the entire area if desired. To operate such a system successfully the rangers need only know reading and writing by way of education in order quickly to master the Morse code for signalling purposes. The international code as used by the British and Canadian forces is the one used. ,

The duties of the rangers include intercepting all persons entering the limits. These travellers are treated with extreme courtesy and promptly educated as to fire dangers. Every possible assistance is given them and when they pass on, their presence and destination is flashed to all stations. Though all this may sound elaborate, the cost of such a system is no greater than the old fashioned method of having rangers poke along like moles, oblivious of all that is going on except in their immediate vicinity. Indeed, if all adjoining limit owners were to co-operate, the cost would be less than the old, inefficient method.

Mattagami Company's Successful Protection

Learning of this system of fire protection Mr. A. G. McIntyre, who, as a technical man has already done so much for the forest industry in Canada, gave instructions for the organization of such a system on the extensive timber areas of the Mattagami Pulp & Paper Company in northern Ontario. During the present summer this system has been introduced and plans are developing for its greater elaboration in detail. So successful has been the operation of this system that, even in its incompleteness, small fires were detected and extinguished before they could gain headway, and from the several prominent lookout stations on these limits dozens of settlers' fires visible thirty and forty miles distant were reported long before they were fanned into the recent great fire. But what could the rangers do? The Act permits settlers to burn their brush at any time of the year, and though sensible and experienced pioneers know better, it must be remembered that most northern Ontario settlers are from parts where bush fires are unknown, and therefore their consequences not appreciated. ,

Had the Act provided measures against the setting of such fires, the fire rangers of the Mattagami Pulp & Paper Company could easily have prevented the spread of these scattered fires by reporting to proper authorities, but alas, if there are such authorities as field men, their presence is not much known in the north. And that the Mattagami limits, though surrounded by the recent big fire, suffered no damage, is not entirely due to good luck, the system claims some credit. Not only can the Mattagami fire rangers cover every square mile of their limits from their stations, but they can now see across settlers' and Crown lands a distance of thirty-five to forty miles into the limits of the Abitibi Power and Paper Company. It is therefore hoped that the latter company, with the Ontario Government, will link up and co-operate with the Mattagami system, and thus it can be extended to the O'Brien limits, where from their stations several station sites are visible on the Abitibi limits. ,

An efficient system at less cost than the present haphazard methods can thus be organized to cover the whole of northern Ontario.

Good Results of Quebec Laws

During the last session of the legislature of Quebec, several amendments were made to the Fire Act, which are calculated to add materially to its strength and efficiency.

One of these provisions requires that settlers engaged in clearing operations must, between April 1 and November 15 of each year, secure a burning permit from an authorized forest officer before setting out clearing fires. Wherever this provision is properly enforced, it will undoubtedly bring about a very material reduction in the forest fire loss. One of the most serious features of the fire situation in all the provinces of Canada is the tendency of settlers to burn debris during dry periods, when fire is likely to spread and cause serious damage. A similar provision is urgently needed in Northern Ontario, where there is practically no control of settlers clearing operations.

Another amendment to the Quebec Act provides that the debris from settlers' clearing operations must, before burning, be piled in heaps or rows at a distance of at least fifty feet from the forest. On this basis, it is much more practicable to control the fire than where the old method of broadcast burning is resorted to.

Holders of timber licenses on Crown lands are required to clear

away the debris on a depth of one hundred feet from railway rights of way. This is an excellent provision, but should be made applicable to privately owned lands as well. In many cases, the efforts of railway companies in the direction of fire protection are largely neutralized through the presence of large quantities of the most inflammable debris on lands immediately adjacent to railway rights of way.

Another excellent provision of the new Quebec Act is that any fire ranger or other forest officer may summon any male citizen between 18 and 55 years of age to assist in extinguishing any forest fire, the rate of pay being specified, and penalty being provided for failure to obey the summons.

The fire laws of the province of Quebec are among the most progressive in Canada, but larger appropriations are needed to make them fully effective. In particular, provision should be made for a larger staff of inspectors. The present staff is not sufficient to exercise proper supervision over the fire rangers on licensed lands, nor is there adequate provision for the protection of Crown lands not under license.—C. L. in "Conservation."

Ontario's Unscientific Fire Ranging

The criticisms expressed in our editorial of August 15th regarding the forest fire situation in northern Ontario are forcibly corroborated in a letter that we have received from one of our readers who is in close touch with conditions in the country that was recently devastated by fire. Although our correspondent does not care to have his name published in this connection, his views seem to us to be so fully in accord with the facts and to justify the criticisms we published so fully, that we feel we should reproduce them in full. Writing under date of August 15th this correspondent says:—

"I have spent two weeks studying conditions very closely in the North country since the recent fire, and would like to make a number of suggestions to you for your thought and investigation.

"1st. The very inadequate and unscientific policy of the government in connection with fire ranging, with which you are familiar.

"2nd. The necessity for the government restricting the townships for settlement, in some proper proportion to the number of settlers annually going into the country. In this way, they will then be in a position to provide such settlers with proper roads, schools, etc., and this will permit large clearings to be made in one place, which will protect the settlers' property.

"The lesson unquestionably demonstrated by this recent fire is that the only safe protection against forest fires is cultivated land. Instead of allowing settlers to go into the bush and cut down two or three acres, setting on fire hundreds of acres more, it would be a great deal preferable to have them in communities and close together, so that each settler's clearing would be a protection to himself and to the community, whereas a small clearing in the middle of the bush is no protection whatever.

"3rd. The main lesson to be taken from the Northern fire, it seems to me, is that the government should certainly give to limit holders the right and authority to maintain and protect their limits. At the present time, they are not allowed to prohibit access to these limits to anyone, with the result that campers, hunters, gum pickers, prospectors, etc., are continually wandering through these limits, setting fires promiscuously.

"When the government sells or leases such a limit to a company, who proceeds with development, they should give that company the right to exclude any or all persons from these limits without a pass or permit from the officer in charge of the limit.

"The only successful method to combat the northern fires is to prevent them before they start, because once a forest fire is under way with a good heavy wind, no human means can stay it.

"With proper fire ranging and such safeguarding, three-quarters of the fires in the country would never start. The balance could be so minimized that the danger would be gradually reduced to a negligible item.

"You will notice in the Toronto World recently, an item relative to this discussion, claiming that the forests are a menace instead of an asset to the province. This statement should be very forcibly disputed because under proper protection and system, the forests and timber lands go hand in hand with the settler in the development of the country; the rights of such should be maintained and can easily be arranged not to overlap in any way."

A Story of Lumber Camp Life

The fascination of life in the virgin forests of Canada has been the theme of many a novel in recent days. Unquestionably there is a wide fiield of romance and tragedy waiting in the north land of Canada for the pen of some literary genius to turn into many a stirring tale. A good story of northern logging life is told in "The Man Trail," by Henry Oyen, published by Geo. H. Doran Company, New York, and sold in Canada by the Musson Book Company, Toronto, at $1.25. The story gives one a capital, though somewhat lurid view of the way in which things are done in a lumber camp. Possibly there is a shade too much melodrama in the book, but it is none the less a stirring tale and one that holds the reader from first to last. Naturally, as one would expect in such a novel, there is a full grown love story running through it and the incidents of the book centre chiefly around the efforts of the hero to make good as a camp foreman, in order to win the hand of the logging king's daughter. The successful way in which the writer keeps up the interest throughout the book is best shown by reproducing the following typical portion:—

"Main Camp was on the last week of the work assigned to it, and Bart, despite his exuberance and good humor, apparently was determined that the job should wind up with a record breaking output. . . . . Under his electric driving the crew swept upon the remaining timber like farmers upon standing grain. The big Norways, white pine and hemlocks fell like wheat before the sickle. In the woods there was the constant Whoosh, 'Look out!' and cannon-like crackle that told of another forest giant thumping in the snow. On the ice roads there was cursing and straining of logging chains as the teamsters vied with each other in moving record loads; and on the rollways there was all day the steady, dull boom-boom-boom of logs rolling down to their berths on the ice-covered river."

" 'The King Pines,' a new forest about to be exploited, rang with the noise of their destruction. Norbya and his crew had completed the erection of the camp buildings. Brackett's gang were through with the work of building a road. The complete crew now was in the woods, sawing and skidding, and, there being little or no swamping required, the log piles at the skidways along the road grew with unprecedented rapidity. At night the sprinkling tank moved up and down the newly made road, the water freezing almost as soon as it struck the snow. By the third morning a narrow ribbon of solid grey ice divided the pines in two parts, and the road by which the giant sleigh loads of logs were to slip to their berth on the ice of the Brule was ready. The haul was short, the road sloped gently toward the river, and, once a load was started, no matter how high Brackett piled the top, it did not stop until it swung up to the rollways on the river bank ready for unloading. Then the chains were taken off, gingerly the cant hooks worked out a bottom log, and boom-boom-boom! Like a volley of cannon shot the logs were rolling down the bank, leaping and tumbling far out upon the solid, snow-covered ice. By the night of the third day a single row of logs five deep spanned the river from bank to bank.

"And now mid-winter clamped its icy hand upon the Big Woods and held them in a grip remorseless. . . . . Wolves, bobcats, lynxes gave up their nightly meat-hunting and slunk to their caves, curling themselves up, waiting impatiently for the days when the sun, drawing nearer, would warm earth to a degree when living things once more could walk abroad. In the brush the spruce hens burrowed deep in the snow beneath the cedar bushes, and the deer, close-huddled for warmth, grew lean in the bare swamps where they yarded. Out-of-doors was an enemy to man. It fought him the moment he stepped out from the shelter of four walls. It leaped upon him, striving to clog the blood in his veins, forcing him into brisk motion to keep the mere breath of life in his body. . . . . These are the days—when all out of doors is a place to flee from the moment work is dropped, and many men must herd together without any entertainment through hours each day—that tempers grow frayed and sullen in logging camps, and short words, blows, and even worse are to be expected as a matter of course. Then, if ever, the camp boss is tested to his marrow. Upon his ability to dominate the rough men under him, to note and quench trouble before it breaks, and to keep his men satisfied when dissatisfaction is the natural state of mind, depends the success of his job, even his own life and the lives of some of his men. The Canadian poet-logger, Dr. Drummond, who made it obligatory on the successful applicant for work in his camp to answer affirmatively at least one of the four questions: Can you sing, play an instrument, dance a jig, or spin a yarn? knew well what such accomplishments meant to the frost-bound camps. . . . . To fight the cold weather and beat it was a matter of pride with the lumber jacks. They were snow country men; they knew that no man had any business in the North who cannot whip the frost devils; and they increased rather than lessened their efforts when the bone-searching cold would have driven less hardened men to hug the fire.

"The ice-covered Brule was being steadily chocked with logs from bank to bank. The sleighing held up into the middle of March, when only a fringe of pines remained along the river, within skidding distance through the mud and slush. One afternoon a stream of sawyers began trickling into camp while the sun was yet high above the timber. 'What's up with you bums?' he queried. 'Matter, you red-headed shrimp! Everything's the matter. We've hit the river, and this —— —— everlasting job is done.' . . . . Came a morning at last when the bare, moist woods were redolent with awakening life. The sun warmed the men, lazily as they emerged from the bunk-house. The men were laughing as they went to breakfast. Down in the stables the horses were whinnying restlessly; and in the silence of morning there came from the river a sudden growling rumbling that held every man in camp instantly spellbound. A second rumble and every man let out a yell. 'She's going—she's going out. Hip, hip, hooray. Come on, you river hogs; she's going down stream!' And thus the drive was started."

Hardwood Logging in Northern Ontario

Standard Gauge Railroad and Steam Operated Jammer Simplify Operations at Marksville by the Stone Lumber Company, Limited

One usually thinks of the logging industry in Northern Ontario as being confined to the production of softwood logs, but there is quite an extensive and growing industry concerned in the production of hardwoods. In the early days, the hardwoods were ignored because of the impossibility of getting them to a place where they could be manufactured. Not being floatable, the hardwoods had to wait for the arrival of the railroads and it is this development that has brought about the extensive production of hardwood that is now taking place in districts that were at one time more celebrated for their softwoods.

From time to time we have had the privilege of describing various hardwood operations in northern Ontario. It is our pleasure now to give readers of the Canada Lumberman an idea of the way in which hardwood is being produced by the Stone Lumber Company, Limited, of Sault Ste. Marie, district of Algoma, Ont. This company operate two mills, one of which is located at Marksville on St. Joseph's Island, near the North Shore of Lake Huron, and one at Day Mills on the C. P. R. line from Sudbury to the Soo. These two mills are operated almost entirely on hardwoods, though a million feet or more of hemlock and pine are included in the year's production.

The company are the owners of extensive limits on St. Joseph's Island. When commencing operations they decided that they could not log profitably with horses and they found it necessary to build eight miles of standard gauge railroad running to the centre of their limits on St. Joseph's Island. At the end of the railroad are located the yards in which they deck their logs, these yards containing from 5,000 to 10,000 pieces. One of our illustrations shows a section of a yard containing no less than 18,000 maple and birch logs belonging to this company. As the railroad runs right through the timber the company are able to skid a considerable quantity of logs from the stump to the track. The balance are drawn by a short sleigh haul, permitting of some six or seven trips per day to the yards. Alongside of the track the logs are decked on skidways which contain about 400 logs each.

Loading the Logging Cars

The operation of loading the logs upon the cars, for shipment to the mill, is one which involves the use of an engine and jammer. With this equipment they can load about one log per minute. The use of the jammer is shown in one of our illustrations. The jammer has 2⅝-in. guys and a ⅝-in. cable. It is built on a very low truck and two men can move it from one skidway to another in about twenty minutes. Two timbers, 8 x 12 in., are used to move the jammer on and off the railroad track. While in operation the jammer rests upon these timbers. The poles of the jammer are 24 ft. long, being mortised into hardwood timbers 10 x 10 in., which in turn are bolted to the runners. The runners are 10 x 10 in. timber rounded at both ends. The axle of the low truck is bolted to the runners so as to permit of the jammer being moved from place to place in the easiest manner. This jammer will load a hardwood log 19 ft. long, 23 inches in diameter and has frequently done so, though the company does not make a practice of cutting logs so long. The average length of its logs is about 12 feet.

In making up a train load of logs the company load 2,500 feet on each car and four or five cars complete a load. This could be increased to six or seven cars if the company wished to spend sufficient money to reduce two heavy grades on their line. At the mill end of the line the company have their operations worked out in a very successful manner. The outer rail of their logging railroad is raised 6 inches, and when the patent stake holders are free the stakes drop and the car practically unloads itself into the log pond. The logs are then at the foot of the jack ladder and they are sent through the mill before they have time to sink. The manufactured product as it comes from the mill is piled directly on the shipping dock.

The rolling stock operated upon the logging railroad includes two locomotives, one being a standard 50-ton machine with air brakes, etc., and a large tender. The other locomotive is a Baldwin dinkey, 25 ton, carrying 180 lbs. of steam, with cylinders 14 x 20 in. The latter locomotive is the one they are using mostly.

The logging cars were manufactured by the company. They have 33 in. wheels and 5 in. axles. Each car is fitted with a Russell patent stake holder. The company have ten cars and are able to double their present log output when they find it necessary.

Railroad a Paying Proposition

The construction of this railroad was a heavy and expensive task, but when the saving effected by it is taken into consideration, the company feel that it has been a most profitable investment. This method of logging hardwood is designed particularly to reduce the handling of the logs by manual and horse labor and to allow the stumpage to be cut closer than would be possible if logged in the old-fashioned way. Anyone who has had experience in the production of hardwood lumber in Algoma knows that the rough and smaller logs cannot be logged and sawed profitably, as hardwood differs from hemlock and pine because a thousand feet of ordinary hemlock logs will make 1,100 or 1,200 feet of merchantable timber, but a thousand feet of hardwood logs does well if it makes 800 feet of merchantable timber. The latent defect in hardwood always equals the overcut and the number three does not pay for its saw bill, though there are buyers in Ontario who have nerve to offer $6 and $7 per thousand for No. 3 one inch boards.

The illustration of a yard of hardwood logs shows that the company leaves the woods standing around the log yards. This is done for two reasons; first, because it affords protection against drift and storm in winter, and second, because it protects against fire in summer.

The offal from such a cut of hardwood is very large and the Stone Lumber Company would be glad to sell it to a manufacturer who could use it either for toys or other small wooden article, or for chemicals.

The Duties of a Camp Foreman

On the Job from Late Summer to Early Spring—an Outline of His Various Responsibilities.

By W. J. Beasley*

The foreman of a logging camp occupies one of the most responsible of all the positions in connection with the various operations connected with the production of lumber. Upon his ability, perseverence and loyalty to his employers depends in very large measure the success of the whole operation. Only by the most efficient attention to detail, day in and day out throughout the logging season can a foreman secure his stock of logs at a cost that will enable the owner to make a profit out of them when they are manufactured into lumber and sold. Moreover, a camp foreman has to do with a class of labor that is notoriously more difficult to handle than any other class connected with the lumbering industry. His crew is made up of many kinds of men who are working in the open throughout the bitterest of Canadian weather and unless their wants bodily and mentally are carefully looked after their output will suffer.

A logging camp foreman must first of all be thoroughly acquainted with bush life, that is to say, he must understand the men who live in the bush and he must know from long experience all the important details and peculiarities of this type of life. Next to this knowledge it is most important that he should understand fully the quality of timber upon which his crew is to operate. As a rule the custom is for the company to give their foreman a map of the limits; then he must know the rest.

The first thing the foreman does is to look up a camp site, located where it will be most convenient for the operations, about the centre of his cut. In putting up the camps he must exercise careful judgment in their location so that they may be as sanitary as possible. For this purpose he will make sure that the water supply is on an elevation above the camps, so that no drainage can reach it from the buildings. The size of the camps will be governed by the quantity of timber the company instruct the foreman to take out. An average camp in new Ontario will vary from 100 to 125 men.

The cooking staff in such a camp consists of three men, a cook who generally stays right at his bread tray, a second cook who attends to the cooking of meats and vegetables, and a chore boy who washes dishes and helps wait upon the table. There is also an outside chore boy who brings in wood and water, sweeps the men's camps and scrubs them not less than once a week. The outside chore boy also puts out the lights at nine o'clock at night, lights the fires, etc. Another man takes charge of the stables, whose duty it is to see that the horses are well cared for. A blacksmith and a woodworker are employed to keep the horses and rigging in repair. The clerk and the foreman live in the office, where the clerical work is attended to. The men already referred to make up what may be called the staff at camp.

Among these men, one of the most important from a material point of view is the cook. Great difficulty in connection with most camps is experienced in retaining employees. If a good cook is secured, his services will go a long way towards removing this difficulty, as good food will keep a crew together better than anything else the company can furnish. As a rule, the companies in northern Ontario always supply the best of food stuffs so far as quality is concerned and a remarkably wide variety, so that it is the fault of the cook if the men are not properly fed.

The blacksmith is also a man of much importance to the camp, so that the horses' feet may be kept in good repair, as horse flesh costs a lot of money.

The men in the woods are usually grouped as follows:—

A cutting gang consisting of three men, one called a fitter, who notches the tree, and two sawyers who fall it. The fitter then measures the tree into logs and the sawyers cut it up.

A skidding gang, consisting of team and teamster, two rollers and two trail cutters. Often there are two teams in a gang, three rollers and three trail cutters, varying according to local conditions and requirements.

A road gang, who cut the sleigh roads. There is no particular number to the road gang. When a man is laid off in any of the other gangs, the foreman calls on the road gang for a man to take his place as it is important to keep the gangs full so that they may cut and skid their full number of logs each day.

The duties of the foreman are of a varied nature, consisting to a great extent of overseeing and being responsible for the whole operation of the camp. He inspects his camps every day, to see that the men are properly cared for and to see that everything is going along smoothly in the cookery. He makes his rounds every night to the stables to inspect the horses and assure himself that they are in good repair. Then he goes to the shop to see that the tools belonging to the different gangs are in good shape.

After turning the men out in the morning the foreman goes to the woods and inspects each gang to see that their work is going along properly. Then he occupies his time with looking up roads and marking them out. Then the roads are cut and the skidways built ahead of the cutters. Log makers go along each side of the roads and the teams follow after and skid the timber. When all these operations have been completed the sleigh haul starts, usually about the first of January.

The operation of a camp is dependent more than anything else upon good roads. In making a road a large V ploogh is first drawn along the track as marked out by the foreman. Then a patent plough is run over the road, removing the snow almost down to the ground. Following this comes the large water tank, which holds from forty to sixty barrels of water. This is hauled over the road and automatically sprinkles it so that a solid sheet of ice is formed upon the surface. With such a road it is a comparatively easy matter to draw very large loads of logs. The log hauling is done in the day time and the tank is operated at night. In this way a good road is maintained throughout the hauling season.

In order to keep the roads up during the day time, men are placed all along in sections, every man having to keep his section in repair. Wherever grades are encountered upon the road an extra team is located to assist in pulling the loads up. Wherever there are hills to go down a man is located to burn sand and dust it in the runner track, so as to let the load down as easily as possible.

A loading gang consists of four or five men. The foreman will arrange how many trips the teams must make to the landing each day, depending upon the distance to be travelled. At the landing men are located to unload the teams.

After the writer's operations have been finished, it is the foreman's duty to see that all the dams on the creek where his logs are landed are shut down tight so that they will be full when the ice goes out. When the drive starts, the foreman places men on the dams and at the rapids to keep the logs running through. When they come to a lake the logs are boomed and towed across by alligators or steam winches to the mouth of the river where they are cut loose and allowed to run to the outlet. There they are passed through a gap or sorting jack and each company's logs are placed in its own booms ready to be towed away to the mills. When the logs are delivered in the company's booms at the sorting jack the camp foreman's work is completed.

It is easily seen from even such a brief glance at a camp foreman's duties that his job is no easy thing. He must be alert and constantly on the job to make a success of it. To get the best results from his men he must watch their work closely so as to learn what they are best adapted for. Often he will have to change them from one class of work to another in order to get the best results from them. In short, a foreman must study the dispositions of his men. He must also feed them well and care for them well. To sum up, the foreman's best guide is "do unto others as you would be done by," which is the best motto for him to follow.

The duties of the camp clerk are quite different from those of anyone else at the camp. He keeps a set of books in which the men's accounts are entered, and he looks after his "van" which is well filled with supplies for the use of the men. He keeps a record of the number of logs cut each day, as reported to him when the men return from the woods at night. He sends a weekly report of the logs cut and also a monthly report, to the head office. In addition, he records the logs in a book furnished by the government which is open to the inspection of the government scalers at any time. He looks after camp supplies, orders what is required and keeps a general tab on everything around the camp. When the season's work is finished he submits his books to the head office, where they are inspected.

*Foreman for Graves, Bigwood & Company.

A Camp Foreman's Description of His Work.

By Chas. H. Goodhand*

According to my experience, the first thing for a foreman to do when he goes into the woods in the fall, for a new camp, is to look for a good place in which to locate the camp buildings, and to get them as near as possible to a good spring, as good water is a very important factor in camp life. Then it is wise to build as good a camp as you can. The cookery should be put up so that there is lots of room for seating all the men at once. I always locate the cellar for potatoes and vegetables under the cookery and the meat house to one end, so that it is handy for the cook. In building a sleeping camp I believe in giving lots of room for the men to lounge after their day's work. The best way to get good work out of the men in the camp is to use them well, which involves seeing that the camp is always clean and warm and that the men have good clean bunks and warm blankets.

My company always supplies everything I order for a cook, real-

* Foreman for the John Carew Lumber Company.

izing as fully as I do, that it pays to board the men well. We always give the men beef and pork, potatoes and all kinds of vegetables, a wide variety of pastry, as well as bread and buns. With such a bill-of-fare, the men are always satisfied.

At my camps the lights are always out at nine o'clock. I do not believe in ordering men out in the morning before they can see to work. I call them out of their bunks at such a time that after they have had their breakfast and reached the woods it is light enough for them to see.

When cutting and skidding I always use two pony gangs and cutters ahead of a team skidding and six men in a skidding gang, two trail cutters, two rollers and two teamsters. Quite a lot of our skidding is done single, but when we get big logs and have to double the horses up then one teamster goes ahead and cuts out the next skidway. I find that it pays to use good heavy skids and to deck the logs up "good and high," so that there will not be much tailing or snow shovelling to do when the drawing time arrives. I always use block and line for rolling and loading.

Making the roads is a very important matter. It pays to make good roads. I always try to get my main road cut and graded before the frost comes. I use 10-foot bunks, and I have had about a four mile haul for the last five or six years, making four trips a day. The lead team leaves the stable at five o'clock in the morning. It will be in for one hour at noon and will be back again about a quarter to five at night. I keep three men on that road, keeping it shovelled and levelled down and two men with a team on the water tank and snow plough. I do not think a man can log well without a good plough and tank. It certainly pays to keep a road well iced. I calculate that I can draw twice as many logs on an ice road as on a snow road.

One of the most important places in which to employ good men is at the loading. I use four men in a loading gang, always putting the best hook men I can get to load, for if a man does not get his teams loaded quickly he cannot get them in early at night. I like to see the tail team in before dark.

Logging Operations on J. R. Booth Limits

By W. G. Mackay

The duties of a logging camp foreman are many and varied. If he is a good man, fit for the position, he will see that the men are properly housed in well ventilated camps, that they are well fed, and that good discipline is maintained in and around the camp. Then he will see to it that every man performs the duties alotted to him, in a workmanlike manner. Getting the confidence of the men is a matter of much importance. With this confidence the foreman can get much better results than without it. The men must feel that any work they do will count in their favor, and that the foreman knows his business thoroughly. Nothing will slack a man up more in his work than a feeling that some of it is being done for nothing. It is scarcely necessary to remark that the men must be well fed. Good food is a most important factor in their work.

In connection with our operation we build good camps, either of frame or logs, with the required air space for each man, and we make our camps as sanitary as possible with outside water closets placed at the regulation distance from the sleeping or eating quarters. The camps are furnished with good sweet straw and blankets. Some of our camps are lighted with acetylene gas and some with coal oil lamps.

The work of the camp is divided among different gangs. First there are the log makers who fell the trees and cut them into the desired lengths, then the trail cutters who cut the trails from where the logs are made to a convenient spot where they are drawn and piled in rollways. Then come the team of horses, the teamster and the chainers who haul the logs out on the trail and pile them in rollways. Next are the main road cutters who cut the road for the sleighs, the trail for the road having been blazed by the foreman or by the head road cutter, the latter being directly in charge of the main road cutting gang. The roads are grubbed and levelled off by using picks, grub hoes and dynamite, the latter being used for large rocks and stumps.

When the snow comes and the cold weather, the roads are tracked out with horses and a large water tank is drawn over the roads to water them. Afterwards a large snow plough is put on and the surplus snow and rough ice are scraped off. After each fall of snow the plough is run over the roads, two and three teams of rough horses being used to draw it.

The main road is kept in shape, smooth and well iced, by the use of the water tanks, so that one team of horses can draw a very large load with ease. If there should be a high hill upon the road up which the load has to be drawn, we use steam engines and an endless cable five-eighths of an inch in diameter.

When everything is ready for drawing, the logs are loaded on sleighs with long bunks and are drawn to the dump, where there is a siding, as all our timber is transported to the mill by rail. At the siding the logs are loaded on cars with steam hoists. The cars are then billed out and the train starts over our own line and then travels over the G. T. R. to Ottawa. During the summer months we cut and peel spruce, balsam and hemlock for pulpwood. With the exception of the men who do the peeling, this operation is very much the same as the other.

From Daylight Until Dark

Logging Foreman and Crew Labor as Long as There is Light

By Sam Brownlee*

At this time of year the foremen of logging camps are getting busy on their work for the coming winter or in some cases have already made a start. When the foreman of a logging camp goes into the woods he takes complete charge of everything connected with the camp designated to him by the firm for which he works. He allots the different men in the crew to their various lines of work. Our camps usually open their operations for the season some time between August 15th and September 1st. As a rule I have one hundred men in my camp, made up as follows; 16 men cutting logs, 18 trail cutters, 11 main road cutters, 15 men driving teams, 10 men rolling logs, 5 men loading logs, 4 men unloading logs at the dump, or river, 11 men fixing roads, 2 men in the blacksmith shop, 1 clerk, 1 cook and 3 assistants.

When the men are sent out into the bush for their day's work they are divided up into gangs; a gang consisting of 2 log markers, 1 team with teamster, 1 chainer and 2 or 3 trail cutters. The log markers fall the trees and saw them into lengths of from 12 to 16 feet. The trail cutters follow the log markers and cut the roads to the logs that have been made. Then the teamster comes along with his team and hauls out these logs to skidways. The logs are piled on these skidways by the chainer (the teamster's assistant) along blazed trails which I have already made. Later, I send in a gang of road cutters to cut out a road along this trail. This is called the main road. We do not begin to haul the logs out on this road until there is sufficient snow to make good sleighing. Then the logs are hauled to the river or to some navigable stream and left there until spring, or until the ice is cleared off these streams. Then they are run into the Ottawa River and once they reach the Ottawa they are taken in charge by the Upper Ottawa Improvement Company, who are responsible for their delivery to the mills in Ottawa city.

As a rule we stop making logs about the first of January in each year. After we have caught up with our winter work we let all the men go. Then we bring in men to drive our logs out to the Ottawa River. When this has been finished the season's work is at an end.

The camp clerk has a number of important duties to perform. He keeps the time of the men in camp. He also takes charge of the store attached to the camp. In this store we keep everything needed by the men and we make a point of selling to them at a reasonable price.

In order to keep the men at their work it is important to board them well and furnish them with good comfortable quarters to live in. We use the very best provisions for our men. We also employ first class cooks for the camp, as a poor cook and poor provisions are really very expensive. We also employ a good blacksmith who does the shoeing of the teams and repairs wagons and log sleighs.

During the past year the wages paid to our men were as follows log makers $26 per month, teamsters $26, road and trail cutters from $18 to $26, with board included in each case. We employ an assistant for our blacksmith, whose wages are $40 per month. The blacksmith receives $70 per month, board included in each case. The hours of labor in the winter months are from day-light until dark.

We generally put our supplies in the camps during the previous winter's operations, as it is much cheaper to haul supplies by sleigh than by wagon. Besides, the roads are better for that purpose in the winter than in the summer.

* Foreman for J. R. Booth.

Recruiting for the 242nd Overseas Forestry Battalion

A central office and two branches have been opened in Montreal for recruiting for the 242nd Overseas Forestry Battalion. Posters in English and French are on exhibition, appealing for men, especially for those who have had experience in forestry work. Authority to recruit throughout the Dominion has been granted, and plans will be made with this end in view. The following officers have been appointed: Lt.-Col. J. B. White, Officer Commanding; Capt. C. H. Massiah, Captain; Capt. Alex. Fenton, Quartermaster; Capt. H. M. Suckling, Paymaster; Lieut. F. W. Morse, Asst. Adjutant; and Lieuts. G. M. Strong, A. L. Sanders, E. D. James, N. M. Ferguson, and G. H. Rochester.

Logging Methods on Vancouver Island

Description of Equipment and Organization, Felling, Yarding, Transportation and Scaling Operations in a Typical Camp

Logging operations on Vancouver Island, B. C., resemble in many respects those in other parts of British Columbia. In a typical camp operating under conditions existing just previous to the war, the logging operations were conducted along the following lines:

One man was is charge both of the mill operations and the logging. Next to him came the walking boss or foreman of the logging, with a sub-foreman for railroad construction. The walking boss is also time-keeper, cruiser, and has charge of the van and the railroad. Labor was then easily secured but very unstable, as is common in B. C. camps.

The camp we have under consideration employed about 16 whites ot 30 Asiatics. With one exception all the most important and responsible outside positions, such as engineers, loaders, fellers, etc., are held by whites. The exception is one of the two loading crews, composed of a Jap with a Chinese assistant. The cook and cookee for the whites are Chinamen. The less skilled labor, such as railroad construction, bucking logs, hewing wood and carrying water for the donkeys, is performed by Chinamen. The hours of work are from 7 a.m. to 5 p.m. with one-half hour for lunch. The men are carried to and from work by the company's train.

The company charges the white men $5.25 per week for board and lodging. The Chinamen hire one of their number to act as cook, buy their own provisions and board themselves for about 15c per day.

The wage scale in this camp, previous to the war, was probably a little below the average for British Columbia, at least of the better class of operations. Wages do not include board and were as follows:—

Foreman	per year	$2,000.00
Sub-boss on construction	per day	4.00
Locomotive engineer	per month	120.00
Donkey engineer	"	100.00
Locomotive fireman	"	80.00
Fireman on donkey	per day	2.00
Waterman	"	1.75
Snipers	"	3.50
Swampers	"	2.75
Signalmen	"	1.75
Fellers	"	3.50
Log buckers	"	2.75
Fuel cutters	"	2.00
Chinamen on railway construction	"	1.75
Brakemen	"	2.25
Loaders—White	"	3.50
Loaders—Chinamen	"	2.75
Cook—Chinamen	per month	60.00
Cookee—Chinamen	"	35.00

The camp was placed near a small stream of pure water. The buildings were grouped on each side of the track about three-eighths of a mile from the donkeys.

About one square mile is worked from each location of the camp, then the buildings are loaded on cars and moved to a new site. The whole operation takes about four days, generally.

The construction of such camps is very strong and rigid to stand the rack of moving. The buildings are frame, of 2 x 4 scantling, inch board siding, and roofing of inch boards covered with tar paper.

The sizes are as follows:—

Cook-shack, for whites	20 x 40 ft.
Office and van, foreman	20 x 20 ft.
Bunkhouse for 18 whites	20 x 30 ft.
Repair shop	10 x 20 ft.
Store and tool house	15 x 15 ft.
Chinamen's cook shack	20 x 20 ft.
Chinamen's bunkhouse, 30 men	30 x 35 ft.

The commissary stores are easily replenished by rail from Victoria. The meals were well cooked and fresh meat and vegetables formed a large part of the menu.

The Van or Camp Store is conducted by the foreman. Only the few articles most commonly needed are kept, such as boots, socks, underwear, shirts, pants, oilskin coats, oilskin and felt hats, gloves, tobacco, soap, matches, etc.

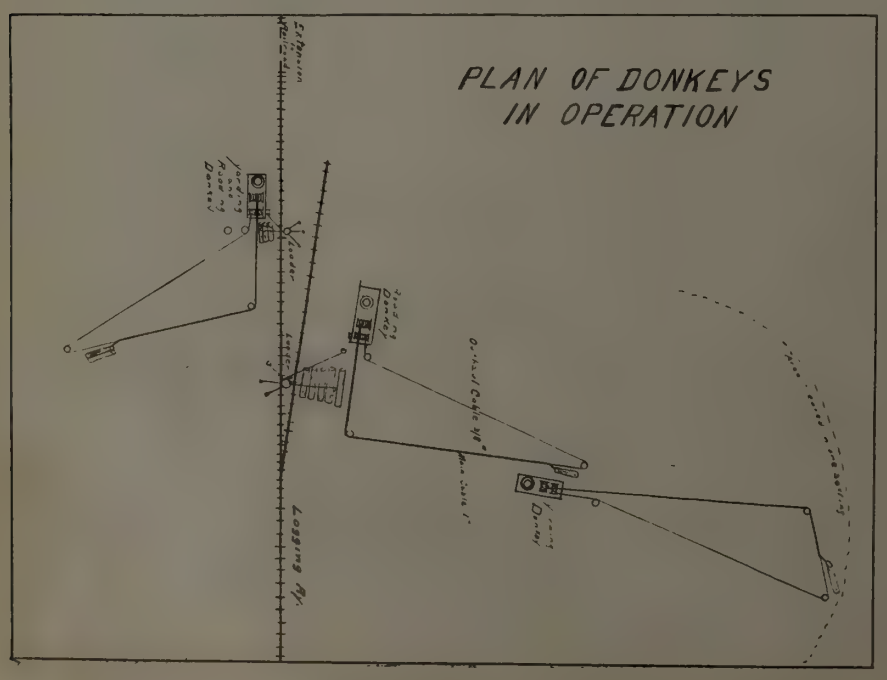
Tools and blacksmith supplies are kept in the repair shop, and include hammers, saws, augers, braces and bits, files, chisels, dies for cutting threads, bols, nuts, spikes, nails, rod iron, etc., for rough carpentry and blacksmith work.

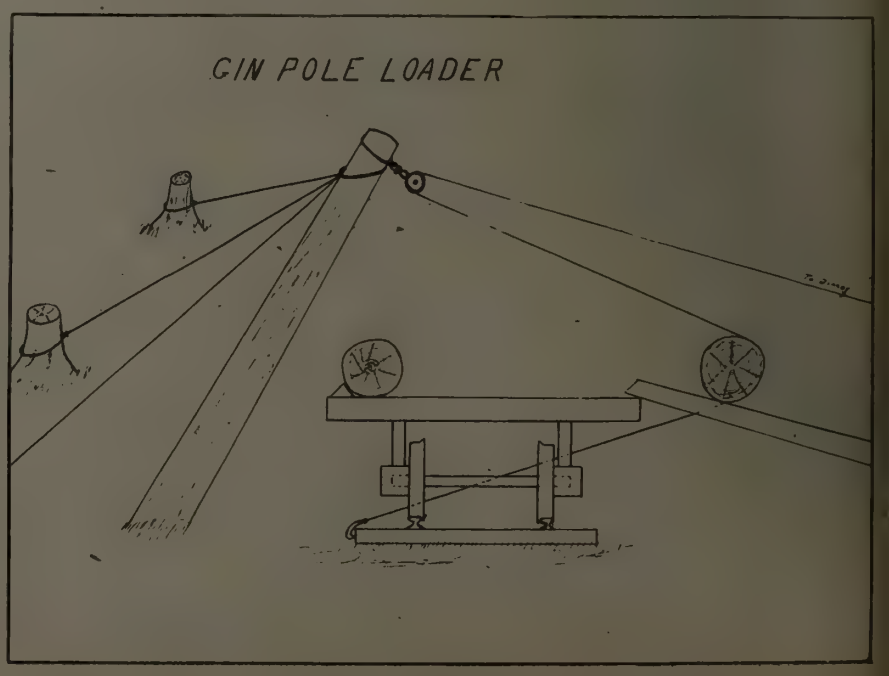
Under a rough shelter beside the repair shop are kept a small portable forge and a filing frame for crosscut saws.

Equipment for Logging

The general logging equipment includes the following:—

Yarding and Loading	Cost
1 Donkey Engine—Washington Iron Works, 10 h.p.	$2,500.00
1 Donkey Engine—Washington Iron Works, 18 h.p.	2,800.00
1 Donkey Engine—Washington Iron Works, 25 h.p.	3,300.00
3500 ft. 1¼ inch steel cable, per ft.	.54
1000 ft. ⅝ inch steel cable, per ft.	.14
3500 ft. ⅜ inch steel cable, per ft.	.07
3500 ft. light wire for signalling	
2 doz. clevices, per doz.	19.00
12 Steel pulleys for loading	
12 Steel pulleys for outhaul	
12 Steel pulleys for main cable.	
Various hooks for chokers, line, etc.	
Hauling	
Railroad, 2½ miles, cost per mile	$3,000.00





1 Climax locomotive, 18 tons, cost	4,500.00
1 Climax locomotive, 25 tons, cost	6,500.00
6 Climax sets logging trucks, cost per set	350.00
1 2,000-gal. steel tank for watering engine	
1 gasoline launch, 35 ft., 18 h.p.	300.00

The railroad operated by the company is a standard gauge and runs from the donkeys in the woods to the dump in the lake. It cost about $3,000 per mile to build. Construction work on the railroad is done by a gang of Chinamen under a sub-boss. This gang is continually employed in extending the line. Stumps and large rocks are removed from the right-of-way by blasting powder. When a spur is abandoned, the rails and such ties as are worth while, are taken up and relaid elsewhere.

There are few cuts or fills and these not large. Grades are mostly 3 to 4 per cent., the maximum being 12 per cent. Curves are all under 10 degrees except one of 35 degrees. Guard rails are laid in all curves. The grading is all finished in earth, no gravel being obtainable.

The ties are of good quality, 30 per cent. standard. Douglas fir and cedar are most used. These are cut along the right-of-way and adjoining by Chinamen. They cost 10c each in string and 12c laid down. The average life of the ties is said to be four to six years. They are laid 14 to the rail. The cost per mile for steel is about $1,500.

Bridges are few in number and small. The larger gullies are spanned by stringers and crib work. The smaller ones are crossed by simply laying two enormous trees across on which the ties and rails are laid. This latter type is, of course, possible only where large timber is available, such as is found in this country.

An elevated stave tank of 2,000 gals. capacity placed by the track a short distance from the lake supplies the engine with water which is piped from a spring on the hillside and fills the tank by gravity.

The dump is a trestlework built out into the water. One side is elevated about four inches above the other so that the logs roll off the trucks by gravity when the chains are loosened. The logs are then boomed and towed to the mill.

The cost per mile of railway is made up as follows:—

Grading, bridges, ties, laying steel	$1,500.00
Steel—rails, plates, spikes, bolts	1,500.00
	$3,000.00

The Logging Operation

The organization of the logging crews is as follows:—

3 Felling crews, 2 men each—whites.
3 Bucking crews, 2 men each—whites.
3 Yarding crews, 3 men each.
1 swamper—Chinese.
1 sniper—Chinese.
1 signalman—White.
2 Loading crews, 3 men each; 1 crew white, 1 Asiatic.
Head loader.
Assistant loader.
Chinaman to 'tend cable.
3 Donkey Engine crews—3 men each.
1 Engineer—White.
1 Fireman—Chinaman.
1 Wood buckler—Chinaman.
1 Water carrier—a Chinaman, served the two donkeys by the railroad. The fireman did this for the small donkey.
1 Railroad crew—6 men.
Engineer—White.
Fireman—White.
2 Brakemen—Chinese.
2 Wood cutters—Chinese.

The felling tools for each crew are:—	Cost
2 axes, 3¼ lb., double-bitted, each	.75c
2 axe handles, each	.25c
1 saw 7½ ft. Simonds, per ft.	.80c
2 saw handles, per pair	.60c
1 sledge	.40c
1 sledge handle	.20c
2 iron wedges, each	.15c
2 spring boards	
1 bottle kerosene oil	

The axes are used for cutting notches for the spring boards and also for undercutting the tree for fellings. The saws are used to make the main cut in the tree. Each crew files its own saw. Wedges and sledge, and kerosene oil are used to keep the saw from binding on account of pressure or pitch. Spring boards, on which the fellers stand when sawing, are necessary as most of the stumps are cut 5 to 6 feet high.

The Bucking crews follow the fellers. Their tools are similar, except that they use no spring board. The bucking saw is heavier and wider in blade than the felling saw. The logs are cut in lengths varying from 30 to 40 feet. In steam logging, long lengths are preferred because they save handling. A donkey can pull a 40 ft. log out as quickly as a 16 ft. one in most of this timber.

The felling and bucking crews each cut up 12 to 13 thousand feet, board measure, per day, at a cost of $1.00 per thousand feet.

The yarding crew proper consists of three men. The swamper

British Columbia logging methods—Logs en route to the mill.

clears the way for the logs and trims off any projecting stubs on the log. The sniper noses the logs and attaches the choker. The signalman, by pulling a wire to the whistle of the donkey, tells the engineer when to go ahead, back up, etc.

The 18 h.p. donkey works independently on one side of the track, yarding and loading the logs from a radius of 900 to 1,000 feet.

The 25 h.p. donkey is located about 200 yards above, and on

A Douglas Fir Forest.

the other side of the track. It roads and loads the logs 1,000 feet. The 10 h.p. donkey is placed about 1,000 feet from the track and serves as a feeder to the 25 h.p.

A donkey engine consists of furnace, boiler, engine, 3 drums and 3 cables. All this is secured to a heavy iron frame and is mounted on a boat. A boat consists of two large logs beveled at the ends like sled runners and held together by cross pieces.

The cables are built of steel wire with a hemp centre which makes them more flexible than solid wire. They are as follows:—

Main cable, 1¼ in. diameter on largest drum.

Outhaul cable, ⅜ in. diameter on second drum.

Loading cable, ⅝ in. diameter on smallest drum.

The main and outhaul cables pass from their drums out into the woods guided by blocks and rollers at the turns and are united at the far ends. When the main cable is wound in the outhaul is pulled out and vice versa.

At the extreme end of the main cable are fastened a number of steel rings to the most convenient one of which the choker is fastened with its load of one or two logs.

The choker is a short piece of cable with a hook at each end. With this a log is snared about 20 inches from the end by one hook, and the other hook attached to the main cable. The signalman pulls the wire as a signal and the engineer winds in the main cable. This tightens the choker so that the log is pulled along. Once tightened it rarely slips except in spring when the bark pulls off more readily. A choker is more convenient for large timber than tongs, because lighter to handle. The life of a main cable is four to eight months, depending upon treatment.

The cost of yarding is approximately $1.00 per thousand feet, board measure.

Loading is done by donkey and gin pole. The latter is a strong log about 30 feet long which is securely guyed upright on the far side of the track from the donkey. It is inclined toward the track so that it leans over the cars when they are placed next it.

The loading cable passes from the small drum or spool of the donkey through a block in the upper end of the gin pole and down to the two loaders proper. It terminates in a steel hook by which the loaders have the logs pulled forward or back until they are in proper position to be rolled up onto the car.

Skids are placed sloping from the car to the ground. The cable is passed around a log, hooked to the far rail and the log rolled up in the bight of the cable.

The third man of the loading crew tends the cable at the drum, which is continuously revolving.

The cost of loading is approximately 20c per thousand.

Hauling and Transportation

A 25-ton engine is used for all the hauling. This engine is shaft driven with all eight wheels drivers. Its hauling power is 1,380 tons on level, and 80 tons on 5 per cent. grade. The fuel is Douglas fir, which is cut and piled beside the track by Chinamen.

The six sets of climax logging trucks are fitted with 10 ft. bunks and have a capacity of two to three thousand feet, board measure, per set. The logs are held on by wedge shaped blocks and binding chains. The train is controlled on the grades by the engine and by hand brakes on the trucks.

The usual train is made up of the locomotive and three sets of trucks or cars. The other three are loaded while the train is away on its turn. About six trips per day is the average.

The cost of hauling to the dump is $2.00 per thousand feet, board measure, and the cost of towing to mill 25c per thousand feet, board measure.

The scaling is all done at the mill by the B. C. scale as the logs come up the jack ladder at a cost of about 2 cents per thousand feet, board measure.

The summary of expense per thousand feet, board measure, for whole operation, works out as follows:—

Felling and bucking	approximately	1.00
Yarding	"	1.00
Loading	"	.20
Hauling to lake	"	2.00
Towing	"	.25
Scaling	"	.02
Depreciation and insurance	"	.25
Total	"	$4.72

The information contained in this article is from a report by H. R. Christie, submitted to the Forestry Department of the University of Toronto.

Unique Railway and Logging Skidder

Logs Dragged by Locomotive on Planks Between Rails—Efficiency Secured by Suspended Skidding

One of the most interesting of the many new logging operations created in the Coast district of British Columbia by the great demand for cedar logs is that of the Mainland Cedar Company. This concern, of which W. R. Brown, of Vancouver, is the principal member, controls some eighty million feet of cedar, hemlock, fir and spruce stumpage at Port Neville, about 150 miles up the coast.

The main values of this holding are in its location, being within

Unique B.C. logging railroad– Logs dragged behind the locomotive.

two miles of salt water, and the high quality of the cedar stumpage. Port Neville lies considerably south of the so-called cedar belt, and this timber has the remarkable soft, clear quality so valuable for lumber cedar, and which the market will always take and pay for. Cedar stumpage of this character formerly existing on Burrard Inlet, Howe Sound and Toba Inlet, is now nearly all cut. No difficulty has been experienced for some time back in obtaining a price of approximately $12.50 per thousand for camp run cedar of this class, the Vancouver mills competing eagerly for it.

The Mainland Cedar Company's camp is on the west shore of Port Neville, two miles or so from the entrance. The camp buildings are substantially built of sawed lumber. The bunkhouses are made long and narrow in order to be partitioned in compartments, each section being fitted up for four men. They are furnished with steel bunks, double deck and of single width, each having springs and mattress. The excellent camp and the fine fare furnished make the operation very attractive to labor. Board is provided at a loss, the charge being only 90c per day per man. Fresh meats, fruit and vegetables are served in abundance.

Heavy Grades Require Unique Railway Methods

From the booming ground in front of the camp the main line railroad extends directly into the timber. As very severe grades were encountered in locating this road, and the haul being short, it was decided not to use cars for handling the logs, but to trail them behind the locomotive. This is now being done successfully. Spiked to the ties between the rails are two fir planks 2 x 6 in., and on either side of these are small hemlock side logs. The huge timbers are presented from leaving the track at turns and "dips" by these side logs.

The entire rolling stock consists of a 45-ton Climax locomotive and a flat car, the latter being used for right-of-way work and the conveying of supplies to the woods. The Climax does all the handling of the logs from the skidder to the log dump. Its schedule is ten trips per day, dragging from 5,000 to 15,000 feet of logs per turn, and as the haul is down a grade of from two to thirteen per cent. the locomotive is seldom overloaded.

An Interesting Skidder

The yarding is done with an Empire Cableway Skidder, manufactured in Vancouver. This is a very interesting machine, and in the opinion of many visiting operators has proved itself much superior to the ground or high-lead yarders. With it the logs are yarded suspended in the air from a skyline stretched from a spar tree at the track to one in the bush, from 1500 to 3000 feet distant. The Empire Skidder is built with the supplementing drum principle, by which the haulback is paid out automatically as fast as the skidding line comes in, thus suspending the log and eliminating the great loss of power met with in systems suspending the load by a brake. The large size of the drums enables the load to travel at a uniform level, thus doing away with the constant manipulation of the levers, as in other systems. All leavers are steam operated, so that the engineer has an easy task.

The speed and large capacity of the machine are remarkable, the load being conveyed at the rate of 900 feet per minute and the carriage returning to the stump at twice this rate. The ability to handle large as well as small logs, to log down hill as well as up, and the great distance it is capable of yarding efficiently, are a few of the special merits possessed by this system, which promises to be widely adopted for British Columbia use.

Logging Operations in Bruce County, Ont.

Methods in use by Cargill Limited, at Cargill, Ont.—Gasoline locomotive, steam skidder and log loader clear the bush clean

The logging operations carried on by Cargill Limited, Cargill, Ont., in Bruce County, are planned and carried out in a thoroughly modern manner. The company operate in a mixed stand of hardwood and softwood in the Greenock swamp, practically all of which is owned by Cargill Limited.

The skidding operations include the use of a Lidgerwood steam skidder which is mounted on a flat car with a 40-foot spar. Cables are run from the spar out into the bush twenty rods on each side of the track and the logs are piled up 15 and 20 feet high along the track. All kinds of logs are skidded together, including poles from 2 inches diameter up to the largest logs. Nothing is left on the land but the brush and stumps.

The loading operations are handled by a steam log loader made by Cargill Limited. This is also mounted on a short flat car. It has a 30-foot boom and will handle about 1,000 feet to the lift in logs, or will load one of the company's cars in three lifts of poles, or smaller logs in a sling. The log loader will also lift the cars off the track and pile them up at a skidway. This operation is shown in one of the accompanying illustrations. The other illustration shows the steam skidder at work, bringing in a load of logs to the track. The ability of the loader to remove cars from the track permits of it being kept on the main track all the time, following up the skidder. The loader also has a device attached to the engine, so designed that when a car is loaded, a line can be stretched out and the loaded car moved ahead very easily without any loss of time. While this operation is going on the boom of the loader is also swinging another car on to the track.

The logging locomotive operated by Cargill Limited, is a standard gauge and is equipped with gasoline motive power, thus removing all danger of fire in the swamp. The track is standard gauge of 35-lb. rails. The locomotive makes two trips a day, drawing 12 cars, which is sufficient to keep the mill running continuously.

After the logs are loaded on the cars in the bush by the loader, they never again touch the ground. They are unloaded in a sorting mill, which has tracks and conveyors running from it in each direction and is so located that each block or log is delivered to its proper place to be worked up into the finished product for which it is intended, the whole process being completed without further handling.

Cargill Limited operations—The Lidgerwood steam skidder bringing logs to the track.

Newfoundland's Extensive Timber Areas

Pulp and Paper, Lumber and Pit Props Sources of Great Industrial Activity—Pit Prop Trade Increasing Rapidly

By J. W. McGrath

FIFTY years ago Newfoundland was importing nearly all of the sawn timber used in the country, from the Lower Provinces of Canada—particularly from Nova Scotia; and even as late as the year 1900 large quantities of timber were imported from these countries. Since then, things have changed, so that at present, little or no timber has to be imported, with the exception of some expensive hardwoods—which the country does not produce. It seems strange that Newfoundland should have had to import lumber although she possessed vast forests of different kinds of timber of her own, but this may be readily understood when it is recalled that up to 1876 there were but one steam sawmill (of 25 horse power), and not more than six water-mills in operation throughout the whole country. Much of the timber used by the fishermen and settlers along the sea-coast in those early colonial days was hand sawn, or more commonly known as pit-sawn lumber. The method no doubt is familiar to most lumbermen, and though crude and entailing much hard labor, nevertheless was a great factor in supplying the essential wants, not only of the early settlers, but of the great Dominion likewise.

From 1876 the lumbering industry began to grow and expand, a knowledge of the timber resources became spread abroad, and several lumbermen from Nova Scotia, New Brunswick and Quebec established mills along the river banks in the best selected forest growths of the country, but it was not until Lewis Miller, of Crief, Scotland—a lumberman of world-wide reputation—came to the country about 1899 that lumbering received its first great impetus. Mr. Miller purchased extensive areas of timber lands along the shores of Red Indian Lake, in the very centre of the country, and at the foot of the lake the town of Millertown was built; and here was established by far the greatest lumbering plant and industry known to the country. Two gigantic sawmills of the most modern type were erected, capable of manufacturing two hundred and fifty thousand feet of lumber daily. A branch line of railroad was laid from the main line of railroad to the mills, and the town of Millertown took root. Lewis Miller had been operating mills in Scotland and Sweden for many years previous, and from Sweden he brought to his mills in Newfoundland a colony of Swedish lumbermen with their families, who imparted a new life to lumbering in the colony, and a greater knowledge of the industry amongst the people of Newfoundland. In addition to the mills of Millertown, Mr. Miller acquired and erected large mills at Glenwood, Indian Bay and other places, and from these centres millions of feet of the finest white pine and spruce were shipped to the lumber markets of England, the United States and South America, commanding the best prices in these markets.

The Coming of Capital to the Island

Lewis Miller remained but a few years in the colony when he sold out his vast possessions and extensive plants to the "Newfoundland Timber Estates"—a company composed of such strong financiers as H. M. Whitney, of Boston, the Reid Newfoundland Company, Harry J. Crowe, of Bridgetown, Nova Scotia, and B. F. Pearson, of Halifax, Nova Scotia. This company further enlarged upon the property bought from Mr. Miller by acquiring other timber lands and mills, and by erecting new mills, and enlarging the capacity of others. From the date of the establishing of the Newfoundland Timber Estates (1902), lumbering became permanently established as one of the colony's industries.

From 1876 to 1910 the sawmills in Newfoundland increased in number from 6 to 273, and the output expanded from not more than one million feet of sawn timber to eighty million feet. At present we have 312 sawmills of various capacities, which employ 6,000 men for about nine months of the year. Though we have lately increased the output of sawmills, we have not increased the output of sawn timber. This is accounted for in two ways. Many of the larger mills, particularly those that were erected by Lewis Miller and the Newfoundland Timber Estates, have gone out of the sawing business, the properties owned by these concerns being sold to the Harmsworths, and Albert Reid Company, of London England, who have, within recent years, established large pulp and paper plants, and the enterprise of pulp and paper manufacture has assumed immense proportions—that of the Harmsworth plant being amongst the largest and most modern in the world.

Another cause of the shortage of sawn timber output is the introduction of the pit-prop business. Since the outbreak of the European war, many of the smaller mill owners found it more profitable to engage in this industry, because the war had produced a ready market among the collieries of England. During the year 1914-1915 something like 100,000 cords of this class of wood was shipped to England, and the amount to be shipped during 1915-1916 will not be less than 250,000 cords, if tonnage can be secured for transportation. In addition to the above output of pitprops about 80,000,000 feet of pulpwood is annually used by the pulp and paper mills.

Timber Resources of Great Extent

The forest wealth is varied and extensive. It is conservatively estimated that 15,000 square miles is heavily timbered. The trees include white and red pine, spruce, fir, white and red birch, tamarack, aspen, witch hazel, and white maple.

Newfoundland pine is a very superior wood, and compares favorably with the best Canadian article. The trees run in height from 50 to 70 feet, and from 12 to 40 inches at the trunk. Newfoundland spruce and fir are used largely in house building and all rough work, because of their great durability and strength. Both spruce and fir, of which the country has enormous areas, locally known as "pulpwoods," are also extensively used in the manufacture of pulp and paper.

Newfoundland tamarack, or juniper, and birch are largely used in shipbuilding, and in the manufacture of furniture, and are excellent for such purposes. The largest and best forests of timber are found in the river valleys and around the shores of lakes and streams, and these belts of timber are to be found in the valley of Exploits, Gander, Gambo and Terra Nova Rivers, and around Grand Lake, Deer Lake, the Humber River, and the many rivers that flow into Bay of Islands and St. George's Bay, on the west coast of the Island.

Only a small percentage of the forest lands has been cut over. So, with few exceptions, where forest fires took place, the forests are all virgin growth. Even those pine areas that have been burnt over are not necessarily injured, as decay does not set in for many years. It is well known to lumbermen of this country, that pine lands burnt more than twenty years ago are now producing good lumber which finds a ready market, being dry, easily handled, and not affected by worms.

Newfoundland spruce and fir woods also retain a certain hardness for some time after being burnt, but not for so long as pine timber. Forest fires have destroyed timber in Newfoundland, the value of which would pay off the national debt many times over. One of the greatest assets this country possesses is its forest lands, and until recently little or no effort was made to preserve this wealth.

In a conference held recently in St. John's, the Premier of the Colony, Right Hon. Sir Edward P. Morris, stated that, according to the estimate of the Harmsworth Company, a square mile of timber land in Newfoundland is worth $45,000, which would place the forest wealth at $675,000,000, assuming that the timber areas comprise 15,000 square miles, which is a conservative estimate.

What is true of the timber areas of Newfoundland can also be said of the forest areas of Labrador, where the extent of wooded lands is much larger, and the forest growth more prolific. Newfoundland claims all the eastern section of that territory; and therefore the outlets to the Atlantic of the vast areas drained by the great rivers that flow eastward to the ocean, and feed the waters of Sandwich Bay, Hamilton Inlet, and many other large bays and inlets along that coast.

It is officially known that this area contains many thousand miles of virgin forest, the intrinsic value of which can scarcely be estimated. This extensive wealth of forest will sooner or later become the great supply depot for the pulp and paper mills of the New World. That the possession of such forest will, ere long, give Newfoundland a distinguished place among the great centres of pulp and paper manufacture in the world, there is no question.

Newfoundland's Industrial Advantages

The advantages Newfoundland possesses for lumbering and pulp and paper industries, briefly stated, are as follows:—

(1) Proximity to the United Kingdom and European markets.
(2) Unlimited supplies of timber and pulpwood.
(3) Magnificent water powers.
(4) Plentiful supply of labor at reasonable wage.
(5) Absolute security of titles.

Reviewing these statements it is sufficient to say that Newfound-

land is one thousand miles or more nearer the United Kingdom than Canada, or the United States, while the south and a large portion of the east coast of Newfoundland are free from ice the whole winter when the St. Lawrence is blocked with ice. With numerous bays and fjords indenting the coast, and large rivers extending far inland, all the timber of the country may be said to be at tidal waters, thus eliminating long and expensive railroad hauls—one of the largest items in the cost of the manufacture and marketing of lumber or pulpwood. The item of rail-haul alone is one of the most expensive in the cost of American and Canadian pulpwood or timber.

The black spruce of Newfoundland is declared by experts in the manufacture of pulp and paper to be the finest in the world for their needs. A feature of the Newfoundland forests is the immense area covered by this class of wood.

No country in the world for its size can excel Newfoundland in the number and excellence of its water powers. There is scarcely a river or stream in the island that has not a natural water power or can be made to give sufficient for industrial service.

Labor is plentiful in the Colony at most reasonable wages for all lumbering operations and for pulp and paper manufacture. Strikes are unknown. The adaptability of Newfoundland to these industries has been amply proven.

The tenure of lease to any piece of timber land in Newfoundland is issued direct to the applicant from the Crown for a period of 99 years. If the owner of a timber area lease disposes of it to another party, a new lease will be issued by the Crown to the purchasers. The timber taxes imposed are comparatively light compared with those in Canada and the United States. The only taxes are an annual ground rent of $2 per square mile and 50 cents per thousand feet on sawn timber, but no tax is imposed on standing and round timber. There is no boom tax, and free use is given of slides, dams, piers, booms or other works on streams to facilitate the descent of lumber and sawlogs.

No tax is levied on pulpwood or pulp and paper made from such wood, and the government is desirous to afford any concessions possible in the way of admitting, duty free, all machinery that has to be imported for sawmills and the manufacture of pulp and paper.

With the Canadian Forestry Battalion

An English Impression of their Methods and Skill

"If you would know the lumberman of Canada and how he works, go to the edge of Windsor Great Park, where the cross-road from Virginia Water Station strikes the main road between Egham and Sunningdale. There, on the Clock Case Plantation, you will see over 150 men of the 224th Canadian Forestry Battalion converting trees into railway sleepers and boards at the rate of anything from 15,000 to 20,000 board feet a day.

"The plantation, which forms part of the lands owned by the Crown and administered by the Commissioners of Woods and Forests, included a considerable area covered with spruce, fir, Scots pine, and larch, with an undergrowth of chestnut. Not very long ago a party of experts looked at the trees with the dispassionate measuring eye of the undertaker, and gave it as their opinion that from this wood it was possible to get 3,000,000 board feet of timber. Today whole tracts of it have been swept clear by the axe, and the quaint square tower of the old royal lodge, which stands deep-set in the wood, and which, so the story goes, by its resemblance to the case of a grandfather's clock gave the plantation its curious name, is visible from the roadway for the first time, perhaps, in a hundred years. And still the Canadian woodsmen go on, eating their way through the wood with a thoroughness that knows no mercy.

"The lumber camp is all Canadian—men, machinery, and methods. The men, who are drawn from all parts of the Dominion, have the bronzed, healthy look and the easy confident swing which we have learned to look for in Canadians. The khaki under their blue overalls proclaims them soldiers; they draw military pay and they know the rudiments of military drill; but first and last they are woodsmen, with their craft at their finger-tips. Every man knows his task and does it with an enviable independence of orders or instructions; yet from the first stage to the last the work proceeds smoothly and harmoniously. Let us follow the process, under the guidance of the officer in charge and the sergeant who is "foreman of the bush."

"Facing the main road stands the mill—'home,' the men generally call it—flanked on the one side by piles of logs and on the other by stacks of sawn timber. Walk along the winding track of a light railway, not yet completed, which passes behind the mill, until you come to a clearing, where burning heaps of 'brush' lopped from the tops of the fallen trees are filling the air with the refreshing scent of the pine. Here and there through the blue smoke you catch a glimpse of a lumberman in a picturesque slouch hat. A little further and you are among a gang of 'fallers.' Watch how they fell a tree, 70 ins. or more thick at the base.

"A man with an axe kneels at its foot and with a few dexterous strokes cuts a deep notch in the trunk a few inches from the ground. Two others with a cross-cut saw cut through the stem on the opposite side. In half a minute the tree begins to lean and there is a warning shout. A second or two later, with a loud cracking and rending sound, it topples and crashes to the ground. Without any apparent effort, the 'fallers' have controlled the direction of its fall almost to a foot.

"Next, without any ado, half a dozen 'swampers,' set to work with the axe, clearing the limbs and straightening up the tree. Simultaneously a 'fitter,' with a wooden rod, divides the stem in suitable lengths, marking the cutting points with a notch; while two other men, one carrying a paint pot, measure the tree, enter the size in a book, and mark the stump and the butt of the severed trunk with a blob of red paint to show that their work is done. Sawyers then cut the stem according to the 'fitter's' marking, and the sections are ready to go to the mill. They are dragged there by horses over deeply scored 'trails' and 'sloopways,' and take their turn to come under the saw.

"The mill itself is a stoutly built structure, made of timber cut and prepared on the spot, and saws and engines coming from Canada. It is practically a raised platform covered by an iron roof, but open at the sides. A log to be sawn is rolled into position on a 'carriage,' which moves backwards and forwards to carry it through a circular saw. Two men, standing on the carriage, control its movements and the position of the log by a number of levers. Opposite them stands the most important man of all, the 'sawyer,' whose trained eye sees at a glance what can be made of this or that log. The hum of the engine and the screech of the saw would drown his voice, so he gives his decision by signs. As the carriage brings a log back through the saw with the bark removed, he will hold up one finger or two, and the 'setter' on the carriage, by the movement of a lever, adjusts the log so that the next cut shall be one inch or two inches thick.

"It is all done without a pause. For hours the saw screeches and throws off a spray of sawdust as it slices up the logs that a short while before were splendid living trees, and all the while other saws, trimming the edges of the boards and cutting off the ends, join in the chorus. Is it surprising that the daughter of the keeper of the wood was reduced to tears when she stood by the mill?"—London Times.

Logging by Contract—Why it Works Well

A great proportion of the logging operations carried on in Eastern Canada, particularly in the province of Quebec, are handled by the contract, or jobber system. It seems that local custom and conditions have much to do with the way in which logging operations can be handled most successfully, and in Quebec province these influences have combined for many years past to make the contract, or jobber system of logging a popular one. There are, of course, many exceptions to this, even in Quebec province, but the jobber system has been worked out to its most successful development there.

A large manufacturer of lumber in Quebec province, in compliance with a request from us, gives the following reasons why his company obtain their logs in this manner. "Providing we have a good reliable jobber," he says "we are able to operate with more economy and also with more speed through the service of a jobber than we could with men under the supervision of our foreman. The reason for this is not hard to find. A jobber is a foreman to a business that is 'his own.' As man is, after all, essentially a very selfish being, a jobber will naturally take more interest in his work than a foreman would. He will keep expenses lower by reducing the waste in tools lost, etc., and in every detail of camp administration he will exercise the greatest amount of wise economy.

"Generally speaking, the jobber has a farm of his own and furnishes the logging crew with produce from it. This produce counts at a low cost. He also knows his neighbors well and understands how to buy from them.

"So much for 'economy'; now for 'speed.' Being in charge of smaller gangs than those under a foreman, the jobber can get more work out of the whole lot, because he can watch their work more closely and reduce the amount of loafing. He knows every man and what he can do. The men he employs cannot hope to appeal to higher authority, and, knowing this, they are less liable to be unruly. Of course, such closer sueprvision as the jobber is able to give means more work done. This fact is well understood by construction companies who employ a foreman to every few men they have working for them, and we all know that the construction companies, as a result of close competition and the best of facilities, are better able to put these labor control experiments to the test than anyone else. Therefore the plan adopted by them is a good one for lumbermen to follow.

"There are many other advantages to be derived from operating through jobbers, but the most important thing of all is to find 'the right man.'"

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Wanted—Quotations on 1¼ in. and 1½ in. Hard Maple lumber. J. H. Connor & Son, Limited, Ottawa, Ont. 15-16-17-18

BASSWOOD AND PINE WANTED.—No. 2 Common and Mill Cull Basswood, 1 in. cull pine, Winter cut preferred. Apply M. Brennen & Sons, Hamilton, Ont. 16-21

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Birch Wanted

WANTED—10 Cars 2½ in. No. 1 Common and Better Birch for Fall delivery. Buffalo Hardwood Lumber Company, Buffalo, N.Y. 14-17

Wanted

Spruce Pulpwood, 2 ft. rossed or 4 ft. rough or peeled Spruce Pulpwood. Advise us what you have. Box 440, Canada Lumberman, Toronto, Ont. 17-17

Wanted

We will purchase several million feet of Spruce, Norway and Jack Pine 1 in., 2 in. and 3 in.; state how the stock is piled as to widths and lengths and quantities now on the sticks in each width and thickness; we are also interested in a limited quantity of 1 in. Mill Run White Pine. Advertiser is a large concern and buys for cash only. Apply Box 441, Canada Lumberman, Toronto, Ont. 17-18

For Sale–Lumber

Spruce Crating

150,000 ft. 1 x 4 and up Sound Spruce Crating, bone dry; prompt shipment. The Elgie & Jarvis Lumber Company, 18 Toronto Street, Toronto, Ont. 17-17

For Sale

One car 3-in. Practically Clear White Oak, all 12 ft.

Two cars 1½, 2, 2½, and 3 in. No. 1 Common and Better Dry Red and White Oak, all Ohio stock.

The Probst Lumber Company,
15-18 Cincinnati, Ohio.

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal, Que.

Doors For Sale

About eight hundred fir doors, also stock of fir and pine finish. All high class; will sell cheap. Box 436, Canada Lumberman, Toronto, Ont. 16-17

Lumber For Sale

We have for immediate shipment:—

BIRCH

11 cars 3 x 6 in. and up, 8 to 14 ft., Log Run, M.C.O. dry.
2 cars 1½ x 5 in. and up, 8 to 14 ft., Log Run, M.C.O. dry.
2 cars 1¼, 2 and 2½ in., 8 to 14 ft., Log Run, M.C.O, dry.
A quantity of 1 in. log run M.C.O. dry.

MAPLE

Several cars 1 in., Log Run, M.C.O., dry.

BEECH

Several cars 1 in., Log Run, M.C.O., dry.

PINE

Several cars 1, 1½ and 2 in., Log Run, M.C.O., dry.

HEMLOCK

1-inch Rough—1-inch P1S—2-inch Rough.

LATH

Several cars ⅜ in. x 1½ in. and 1¼ in. x 4 ft. Mixed Pine, Hemlock and Cedar, extra quality.

SPRUCE

We can take care of any orders in 1, 2 and 3 inch.

BASS AND PINE CULL

In 1 inch, suitable for boxes.

Your enquiries solicited

The Fletcher Pulp & Lumber Company, Ltd,
17-17 Sherbrooke, Que.

For Sale–Machinery

Saw Mill Machinery

Complete equipment for 40,000 capacity mill, including belts, conveyors, etc., with or without boilers and engines. For sale cheap to quick buyer.

St. Maurice Lumber Company,
15-18 Gaspe Harbor, P.Q.

FOR SALE

1—Wicks Gang.
1—Ideal Engine, 13 in. x 12 in.
1—Plain Engine, 16 in. x 24 in.
1—Plain Engine, 5 in. x 7 in.
1—Boiler, 72 in. x 16 in.
1—Boiler, 54 in. x 12 in.
2—Upright boilers.
1—Cookston water heater.
Several steam pumps.

CHAS. PEDWELL,
16-t.f. McVicar, Ont.

For Sale
Woodworking Machinery

1 Jackson-Cochrane 54-in. Resaw; 1 Cowan 42-in. Sander; 1 Jackson-Cochrane 36-in. Sander; 1 Egan 36-in. single Surfacer; 1 McGregor-Gourlay 2-drum 30-in. Boss Sander; 1 Egan 30-in. 2-drum Sander; 1 C. M. C. 8-in. 4-side Sticker; 1 No. 108 Berlin 30-in. double Surfacer; 1 Ballantyne 12-in. Sticker.

17-19 Hamilton, Ont.

Motor Truck For Sale

A White 3-ton motor truck for sale. $2,500 for cash. Thoroughly overhauled by the makers. Apply Canada Lumber Company, Limited, Weston, Ont. 17-17

Saw Mill Machinery For Sale

Two (2) New Waterous Band Mills.
Two (2) 2½ A. Log Carriages.
Two (2) Gun Shot Steam Feeds.
One (1) Dittbener Band Re-saw.
One (1) New Champion Edger No. 405.
One (1) Standard Two-saw Trimmer.
One (1) Overhead Slat Slasher.
Lath Mill Machinery.
Rolls and Drives.
Transfers.
One Refuse Hog.
Sorting Table.
Filing Room Machinery.
Live Rolls, Boxes, Shafting and Driving Chain.

All of the above is new and was never used

For particulars write to Baylss Pulp & Paper Company, Binghampton, N. Y., U.S.A.

Machinery can be seen at any time at Beaupre, P. Q. 14-15-16-17

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

CIRCULAR SAW FILER wants position in band saw mill, under a first class Band Saw Filer, to learn the filing. Box 431, Canada Lumberman, Toronto, Ont. 16-21

EXPERIENCED LUMBER WOODS CLERK wishes to make a change. With same company several years. Good references. Box 434, Canada Lumberman, Toronto, Ont. 16-18

MARRIED MAN, THIRTY YEARS OLD, ten years' experience in office work as Accountant, speaking both languages, desires to change, best of references. For particulars write to P. O. Box No. 69, Three Rivers, Que. 16-24

WANTED POSITION AS LUMBER SALESMAN—15 years' experience in hard and soft woods. Connection Eastern Ontario and New York State. Married man, 37 years of age. Apply Box 442, Canada Lumberman, Toronto, Ont. 17-18

FIRST CLASS SAWMAKING FILER—Wants piece work contract. Shingle or Long lumber mill filing; will take Kendall gang or lath machines by thousand. Open for any proposition November 1st. Arrange now for next season. Apply Box 439, Canada Lumberman, Toronto, Ont. 17-17

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

WANTED a good Ontario White Pine grader to go to British Columbia as shipper and grader. Climate mild and salary good. Apply Box 443, Canada Lumberman, Toronto, Ont. 17-17

A few good saw mill men wanted, good board and lodging, steady work until snow flies.

JOHN B. SMITH & SONS,
17-19 Callander, Ont.

Business Chances

For Sale

Saw Mill, 2½ miles. Limits, Houses, Barns, Store, Farm, Railway Siding in yard. Box 432, Canada Lumberman, Toronto, Ont. 16-17

Timber Limit For Sale

Thirty-six square mile limit, North Shore, License allows cutting all kinds of timber. Contains Hemlock, Birch, Spruce, Pine, Cedar Ties and Poles, Pulpwood and Hardwood. Railroad runs through part of berth. Cheap operation. Splendid opportunity for small mill. Apply Box 423, Canada Lumberman, Toronto, Ont. 13-t.f.

SAW MILL FOR SALE—Capacity 25 M. ft. per day. Located in Alberta on two trunk line Railroads, with good Spruce timber available and good market for lumber. Would like to sell an interest to practical sawmill man who would operate it. A good money-making proposition. About seven thousand dollars required.

Address, G. M. POOLE,
P. O. Box 1353,
17-18 Edmonton, Alta.

For Sale

The Wm. A. Dunn property, No. 94 to 104 Davenport Road, Toronto, Ont., to be sold en block or in parcels.

1. Stock of lumber, etc.
2. Plant, buildings and machinery, subject to existing lease ending on or about 15th December, 1917.

List of lumber, machinery, chattels and description of property can be seen at office of G. M. Gardner, Solicitor, Manning Chambers, 72 Queen Street West, Toronto. 17-17

For Sale—Modern Saw Mill

and 300 Million feet of standing timber in British Columbia, most advantageously located on beautiful lake and main line of Transcontinental Railroad having advantage of $8 per thousand feet in freight rates to best markets on the Continent. Logging and manufacturing conditions ideal and very economical. A fortune for the right parties. Will sell on easy terms and may accept other desirable property in part payment. Principals only.

A. C. FROST COMPANY,
Corn Exchange Building,
14-17 Chicago, Illinois.

Cuba's Lumber Requirements

In the Weekly Bulletin of the Department of Trade and Commerce a report is published by J. C. Manzer, special representative of the New Brunswick Government in Havana, Cuba, dealing with the market in Cuba for lumber. The report in part is as follows:—

Cuba imports annually about 600,000,000 feet of lumber. This consists, for the most part, of pine, spruce and fir, and is imported in the form of inch boards, running from six inches to twelve inches in width; planks two and three inches thick and of various widths, and deals sawn to various dimensions to conform with orders received. This is

shipped just as it comes from the saw without being planed, and when imported in this form is not subject to duty.

The greater part of this lumber comes from the United States, principally the Gulf of Mexico ports, but Canada supplies a large quantity which might be increased to a great extent.

Spruce and pine from New Brunswick, Nova Scotia and Quebec; also spruce, fir, hemlock and cedar from British Columbia would be suitable for all building purposes in Cuba. Besides this class of lumber, Cuba imports quantities of shingles, thousands of crates for fruit, shooks for packing cases, stave heads and hoops for making barrels, and large quantities of broom handles.

Canadian pine, spruce and fir would be quite suitable for the manufacture of fruit crates and packing cases. These are imported cut in exact lengths ready to be nailed together, and tied in bundles. Birch, maple and ash would be quite suitable for barrel heads, staves and hoops. These arrive tied in bundles, and when put together are used for packing beer. Canadian yellow birch and maple make the best broom-handles.

Canadian lumber will fill nearly all the requirements of the building trade in Cuba; and as Canada is a large seller of lumber while Cuba is a heavy buyer, it would be advisable as soon as the war is over, and conditions become normal again, to make an effort to secure a larger proportion of this Cuban trade.

Black Walnut Prices Favor Production

The present year is regarded by the United States Department of Agriculture as a most favorable time for increased planting of black walnut trees in the United States because of the present heavy crop of nuts. The value of the tree is attributed to the very lasting qualities of its wood and the moderately rapid rate of growth in good locations. The region in which walnut growing is practicable extends from southern New England west to the Central States and south to South Carolina and along the northern portion of the Gulf States to Oklahoma. The finest growth takes place in the rich coves of the lower Appalachians and over the Ohio and central Mississippi basins. The price of black walnut lumber in recent years has been consistently high.

Potash in Wood Ashes and Feldspar

Hardwood ashes contain from 18 to 46 per cent. of potash, while ashes from conifers contain from 14 to 20 per cent. The yield of ashes from wood is about 1.6 per cent. in weight and one cord of wood weighs approximately 2,100 lbs. Assuming that four-fifths of the potash in the ashes is leachable, the amount of potash recoverable from one ton of wood containing 15 per cent. of potash is four pounds.

The present price of potash in trade centres in the United States is nominal. The rate per ton is quoted at from $400 to $500, but none is available. The price for the most common form, the muriate, or chloride, containing 80 per cent. of the pure salt (equivalent to 52.7 per cent. of K_2O) was $38 per long ton in July, 1914.

Canada possesses many deposits of feldspar with potash contents ranging as high as 15 per cent., thus constituting a considerable resource of potash if an economical process of extracting it can be developed.

Several chemists are actively engaged upon this problem in the United States. Chemically it has been solved, but capital is still hesitant about investing heavily in any of the dozen promising methods which have been worked out on a scale little beyond simple laboratory experimentation.

Hemlock Bark at a Premium

Great activity in the bark peeling industry in Pennsylvania, is expected this year, the men already under contract numbering from 1,300 to 1,500. The activity is due to the flourishing condition of the leather industry as a result of the European war. The price of hemlock bark has advanced $2.50 a cord since last year, the price offered now being $13. Twenty years ago hemlock bark sold at $4 a cord, and trees were chopped down for the bark only.

The first boat of the two new lumber ship lines between the Northwestern States and Atlantic ports will leave Seattle on November 1, returning from Philadelphia December 15, travelling the route by way of the Panama Canal, and stopping at San Francisco, Los Angeles and other ports. F. C. Knapp, manager of the Peninsula Lumber Company, of Portland, Oregon, is building his own ships for his line.

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

Review of Current Trade Conditions

Ontario

Toronto wholesalers report a little improvement in trade, though really not enough to be spoken of as encouraging. One firm with which we discussed matters tell us that they have received quite a number of enquiries and orders recently. Many of these are coming in by mail, a condition of things that did not even exist three weeks ago. Another firm reports having 51 cars on order ahead. This, however, is not so much a sign of plentiful orders as of unsatisfactory shipping conditions. The mills continue to face a daily struggle in connection with making shipments, being shorter of men than they ever were in the past, and now they are commencing to be handicapped even further by a shortage of cars. However, if the retailers and others requiring stocks will exercise a moderate amount of patience it is believed that the mills will manage to meet most of their requirements with fair despatch. Another wholesaler reports that business is a shade better than it was during July. "Every time we go out we manage to get a fair amount of business," he says. Practically all of this trade is coming from the retailers, indicating that the farming sections are the most active at present. The cities, in fact, are doing very little in the way of consuming lumber, so far as building operations are concerned.

The hardwood situation in Ontario is steady. Stocks in consumers' hands are light and the prospects for increasing them are slim on account of an acute car shortage. Business is still spotty and has been affected to a considerable extent by the hot weather. Prices are expected to advance on account of the difficulty in securing fresh stocks and the broken condition of most stocks on hand.

Eastern Canada

The local market at St. John, N.B., is very quiet, there being practically no building operations in progress. It is rather expected that a slight improvement in this regard will develop during the fall, as the opportunity for investing profitably in the erection of buildings will be exceptionally attractive. Spruce boards are weak, but are not selling at less than $16 on the mill wharves.. Refuse stocks are heavy and about $1 per thousand lower. Stocks of English deals carried over during the winter will not be heavy. From eighteen to twenty million feet will probably cover them all. The price at precent is unchanged, but there is a slight improvement in the demand. A fair number of enquiries are coming from the American market and the base price at Boston has risen to $26. Log driving operations on the St. John have come to an end for the season, the total number of logs rafted being about 50,000,000 feet. There are no logs now left in the St. John River.

The eastern spruce market at Boston shows a better feeling than it has for some weeks past. Large retail buyers are sending in good orders. Random is moving well, the best demand being for 2 x 4 and 2 x 8, which are selling at $21.50 and $24 respectively. The full range of quotations on random is as follows:—2 x 3, $20.50 to $21; 2 x 4, $21 to $21.50; 2 x 5, $20 to $20.50; 2 x 6 and 2 x 7, $20.50 to $21; 2 x 8, $23.50 to $24; 2 x 10, $25.50 to $26.50; 2 x 12, $26.50 to $27.50. Spruce covering boards 5 ins. and up wide, 8 ft. and up long, are a shade easier at $21. For matched boards, 10, 12, 14 and 16 feet, the demand is steady at $24. The trade in hemlock at Boston is a little quieter, the hot weather probably having had something to do with this situation. Shingle prices at Boston are steady. Good brands of white cedar extras are bringing $3.55, and $3.50 is about as low as a really satisfactory extra can be had at. The quotation on white cedar clears is about $3.20, but some makes are bringing 10c more and some 10c less. Good red cedar extras are selling at $3.85 and a few fancy lines are bringing $3.95. An improvement is reported in the demand for lath and quotations are stiffening. A few manufacturers have announced an advance to $4.25 for 1⅝ in., but careful buyers are able to pick them up occasionally at $4.

United States

The outstanding fact of importance in the United States during the past fortnight has been the possibility of a nation-wide railroad strike, the bad effects of which it would be impossible to exaggerate. In spite of this threatening danger there has been no noticeable decrease in trade activity. In fact, most of the reports received indicate that conditions are improving. In the lumber industry, conditions are now considerably brighter than they were a fortnight ago and it looks as though an important turning point has been reached and gradual improvement may be looked for, even to the extent of a return to normal conditions. Continued building activity, renewed heavy buying by the railroads, and an increase in export shipments are the chief factors in this improvement.

The southern yellow pine market has been a leader in the direction of trade betterment. There has been a great improvement in the demand for southern yellow pine and continued improvement is expected. Reports from a number of important producing centres in the south tell of a general advance in prices, particularly in common lumber, which is today bringing $2 a thousand feet more than it was a few weeks ago. In the upper grades the advance shows an average of about $1 per thousand. Some quotations are within $1 of the high basis reached in 1915. The increased volume of trade seems to come chiefly from the retail yard business in central agricultural cities. Retailers have been buying from hand-to-mouth for a long time and their stocks are away below normal. Mills had been curtailing their production extensively. The harvest season was at hand and a car shortage was threatened, all of which factors seem to have persuaded the retailers that it was time to replenish their stocks and they did so almost with a rush.

The trade in northern pine continues steady and prices show little change. Buffalo wholesalers report that the competition of Idaho pine is not now so strong. There is a good demand for the lower grades of northern pine on account of the activity in the box business. Upper grades also are doing fairly well and pattern stock is moving to a moderate extent. A steady trade in northern pine is also reported from Chicago with prices firm, the demand coming chiefly from the yards, corporations and factories. Furniture and crating concerns are expected to declare their needs shortly and some improvement is expected.

The trade in hemlock at Buffalo is about normal. Prices show a slight tendency to advance. Mills are asking 50c more on car lots than they were a few weeks ago. On water shipments prices are unchanged. Hemlock arrivals at Buffalo are plentiful. At Chicago, there is a fair demand for hemlock and prices are a bit stronger, the improvement being the result of the better market for yellow pine. A fairly active trade is reported in hardwoods at Buffalo. There is quite a volume of business on small orders. Thick maple and ash are in the best demand. Prices are firm all round. The hardwood trade at Chicago is steady, but quiet. A fair revival in trade is looked for in the course of the next few weeks. Birch continues the feature in northern hardwoods and there is also a good demand for thick hard maple.

Great Britain

Prices of spruce in Great Britain have recently shown an extensive drop, as a result almost entirely of the great falling off in freights, both for Baltic woods and for goods from America. Many importers are looking for a strong revival in spruce prices before long and criticize present owners for disposing of their stocks at the recent low figures. There has been no marked change in the spot market at London. The free movement of stocks from the docks continues and arrivals have not been quite so numerous. Stocks on hand, however, are sufficient to fill requirements for a good period. Supplies of spruce deals and battens are fairly extensive. The recent drop in prices has been more marked on batten sizes than elsewhere, and arrivals have shown some falling off. Deal sizes are unchanged in price and the demand continues good. Importing firms continue to show much caution in their commitments and are not inclined to accumulate stocks of any kind.

The c.i.f. market for spruce deals at Liverpool is rather unsettled and recent sales are reported to have left the shipper with a loss, especially in connection with liner parcels sent on consignment. Recent cargo shipments are being held by shippers for better values. It is impossible to say anything regarding the outlook for future shipments. Apparently, most of the shippers have disposed of their cuts, and importers are looking for the season to end rather abruptly. The spot market for spruce deals at Liverpool is dull and the outlook is uncertain. Prices today are practically double those of a year ago. The chief sizes showing weakness today are scantling sizes. A demand is expected later on for 9-in. and up.

Manchester importers are looking for steadier prices from now on, especially for spruce. Shipments on the way to Manchester are believed to be very light, and freights have become firmer of late. A recent arrival at Liverpool is said to have paid 375s per standard for freight and it is reported that the Manchester liners cannot accept any pine or spruce for Manchester at present. For these reasons it

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

is believed that the slump in spruce has come to an end for the time being. Enquiries are very scarce.

A moderate improvement is reported in the trade at Glasgow, transactions being more numerous and of greater value. Even yet there is not a large amount of trade to report, but the tendency is more satisfactory. Buyers seem to have recovered from the fright they experienced when freight rates broke. Spruce values have lately been easier to the extent of about 30s to 40s per standard, and there has been a fair amount of trade. Most of the holders, however, are inclined to keep their stocks, in anticipation of better prices.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Markets—Wintered Stocks Likely to be Light

St. John, N.B., August 21st; (Special to the Canada Lumberman): There does not appear to be any likelihood of a great surplus of deals being carried over into 1917 by the mills at St. John. In fact, it looks as though purchasers of the season's cuts will not have much to worry about in the way of stocks which they cannot move, as many of the mills are already idle, and others will be closing down in the near future for want of logs. Of course, all of these mills were not sawing exclusively for the English market, but a number of them were doing so. Moreover, those mills that were manufacturing for the American market were sawing all their stocks plump, so that they could be turned into the English market if occasion required. Undoubtedly, according to the present outlook, only a comparatively small quantity of logs will be carried over at St. John this winter. The total is not likely to be more than 18 or 20 million feet, and most of these will be long American logs. Prices are unchanged and the demand is slow, but if anything there is a slight improvement both in price and demand. A moderate volume of enquiries is developing from the American market which is showing a little more sign of steadiness. The base price at Boston has risen to $26 and there is a firmer tone all around.

There is no improvement to report in connection with the local market, which is stagnant. Very little new building is being undertaken and the factories are simply stocking up with the different lines of material they usually require, so that they may not be obliged to lay off any employees. It is hard to foresee what the winter will bring forth in connection with the local market, but there is still some hope that a moderate amount of building will develop during the fall, and thus help the market. The reason for this hope is that conditions are very favorable today for anyone who is thinking of building. An owner can put up buildings at exceptionally low cost and when the war is over the opportunity for a promising investment of this sort will probably have disappeared.

The spruce board market is still weak, but fortunately the boards at St. John are in comparatively few hands and will be taken care of easily. Not less than $16 is being accepted on the mill wharves. Stocks of refuse lumber are heavy and reductions of $1 per thousand feet are being made.

The St. John River Log Driving Association have almost finished their rafting operations for the season, and statistics of the season's operations will be available in the near future. Upwards of fifty million feet will have been rafted this year, and the St. John River is now clear of logs from its head waters to its mouth.

Shingles are scarce at St. John and the better grades are hard to find, so that prices are somewhat stiffer.

Montreal Market Continues Quiet

Montreal, August 25th; (Special to the Canada Lumberman):—Apart from the demand for shell box lumber, the Montreal market is quiet. Several additional contracts for boxes have been placed by the Imperial Munitions Board, and others have been offered at prices which are unacceptable. Some firms who have completed contracts, have learned by experience that there is no money in the business on the rates quoted by the Board, and have declined further orders on this basis. Such orders are generally the subject of negotiation, with a result that a better price is sometimes obtained. It is reported that the Board will ask next month for bids of a further million boxes. Many firms are behind hand in their deliveries.

Last month there was an improvement in the building permits, the total being $545,870, as compared with $432,490 in the corresponding period last year. The statement for the year to date is, however, $871,000 less than for the corresponding period in 1915.

The shortage of labor is becoming very serious, and reports received here state that in the Ottawa Valley districts several manufacturers have closed down their mills. The scarcity is by no means confined to this section, mills in the province of Quebec finding it difficult to secure the necessary help.

Shipments to the United Kingdom are fair. Spruce and birch constitute the great bulk of the exports, pine showing a distinct falling off. There is no improvement in the British markets, and with freights round 300s per standard there is little inducement to send forward large quantities, even were space more plentiful than it is. The Government are taking considerable room, and prospects are that this condition will continue for some time. Recently a considerable amount of lumber has been shipped from here and from lower Quebec ports by tramps.

The pulp and paper sections are again buoyant. Prices for sulphite pulp have made further advances, and until there is a chance of European supplies going more freely into the United States, the upward movement is likely to be in evidence. The immense gain in the Canadian exports in pulp is shown in official figures for the year ending June 30th last. During that period we shipped 70 per cent. of the imports into the United States, a gain of 130,000,000 pounds over the previous year. Ground wood is also a good market, while the demand for newsprint is again excellent. The exports are increasing rapidly, notwithstanding the rise in values, and it is hinted that a co-operative association for assisting the distribution of our product in foreign countries may be formed.

Serious bush fires in the Lake St. John district are reported, also in the seigniory behind Murray Bay, behind Canard River, between Bergeron and Escoumains, at Anse St. Jean, at Cape Trinity, along the Peribonka River and in the National Park.

Ottawa Trade Affected by Labor Shortage

Ottawa, August 25th; (Special to the Canada Lumberman):—"Very little change in the lumber market in the past few weeks, but quite a change in the labor supply," is the way in which Ottawa lumbermen express themselves about the situation. Labor, according to all the manufacturers here, is the one great trouble at the present time, and the scarcity has become so noticeable that one mill, that of the Hawkesbury Company, has shut down on the night run.

This action has been taken because of the scarcity of labor due to recruiting and other causes, among which is the demand for harvest hands in the western provinces, this alone having taken many hundreds of men from this district. The McLachlin Bros. mill at Arnprior, Ont., has also been closed down quite recently, but all the others report a fair amount of business and little change in the market.

Manufacturers say there is little likelihood of any important change and not any great likelihood of a rise in the selling prices, although the scarcity of labor is increasing the cost of production. It is estimated that in some lines the cost of labor will be increased to 20 per cent. over a year ago, and while this may later have an effect on the selling price of materials, no move toward a rise has yet been made.

The prospects for the building trades are unchanged. Retailers report little change in the amount of goods passing through their hands and the general opinion is that prospects are "fair."

With the return of harvest hands from the west, it is anticipated that the labor market may ease up a little, though scarcity of men will again be felt when the work in the woods opens. The export trade is steady.

News has been received of the death at Minneapolis, Minn., of Mr. John Sims, a wealthy lumberman of that city, formerly of Ottawa, where he started on a small scale many years ago. He moved from here to Saginaw, Michigan, and has many relatives still living in Ottawa.

Schooners Doing Well in Transatlantic Trade

Parrsboro, N.S., August 19th; (Special to the Canada Lumberman):—The shipments of deals and scantling from this port to Great Britain since July 19th, total 5,061,182 feet. This was carried by one steamer and four tern-schooners. The shipments consisted chiefly of spruce, but some cargoes contained a quantity of hemlock lumber, and the cargo of one schooner was composed entirely of birch deals. A Norwegian ship which will carry nearly three million feet, will finish loading in a few days, and several schooners are due to arrive, so there

Established 1894 ***Incorporated 1908***

Campbellton, New Brunswick

is not likely to be much break in the deal shipments for some time to come.

The lumber shipments to the United States during the last month consisted of 632,378 feet of spruce and hemlock boards and scantlings and 365,000 spruce laths. Several small cargoes of deals have been shipped to St. John, N.B., for transhipment at that port.

The tern schooner Exilda, which made four successful transatlantic trips with deal cargoes last season, has just completed her second voyage this year, and is loading again for the other side. Her last round trip, which was to Preston, England, was made in seventy days, which is considered remarkably good time for a sailing vessel. Another tern schooner, which cleared from Parrsboro on the 17th ult., and was delayed two or three days by fog, arrived at Preston today. Another schooner which sailed a week earlier went across in thirty days. It will be seen, therefore, that the schooners are doing much better than some wiseacres thought they could, and they compare very favorably with the "square riggers."

The four-masted schooner, built this season in Port Greville, on the lines of the one that was torpedoed last year on her first voyage, is now nearly completed, and will be launched, it is expected, on the 28th inst. Shipbuilding in this vicinity has been greatly handicapped by the scarcity of men. This, of course, is largely due to the war, which has taken heavy toll among the sturdy shipwrights. Very few men can be found today, in the shipyards along shore, who are not above military age. But, of course, the war is not wholly responsible for the scarcity, for prominent among the causes is undoubtedly the sharp decline in wooden shipbuilding of a decade or more ago which left few inducements to young men to learn the trade.

The scarcity of shipwrights finds a parallel in the marked scarcity of sailors, and if it were not for the Scandinavian seamen, some of our vessels would find it practically impossible to get across. Even as it is, vessels are sometimes held up two or three days while sailors are brought from other ports to complete their crews. Freights are lower than they were six months ago, and the price of lumber has fallen, but sailors' wages are higher than they ever were before and the tendency is still upward. At present the wages of able seamen are at least fifty per cent. higher than they were a year ago, while even green hands can command big wages.

Good Advice for Loggers—

Safety-First Principles Tabulated by a Large Operating Company

A western lumber company with extensive woods operations has prepared the following set of safety-first rules for loggers and others in their employ:—

Loaders.—Do not load a car unless hand brake is set up tight, and if the car be on any grade, see that the snub line with a clevis is fastened to the car.

When moving cars ahead, as soon as same are spotted, set up all brakes on both loaded and empty cars.

Take no chances in working or walking under or near logs lifted in the air with hooks. Never use hooks to lift a log scaling more than 1,500 feet (it is very dangerous to do so as the hooks are liable to pull out and fly). Logs scaling over 1,500 feet should be rolled onto the cars with straps fastened from the gin-pole, and used as a crotch line.

Do not fasten a hook to any portion of car, except the car bunk or axle.

Do not load logs upon car at the landing until the track is thoroughly cleaned out, and the rail clear of all mud, chips, sticks and other obstructions, and all limbs cut off the logs and stamped on both ends.

Always see that the chock blocks on the bunks stand straight up, and that there is no slack in the chain.

Use no blocks or rigging that are not perfectly sound and safe in every way.

Fallers.—Never stand close to trees when falling.

Always give plenty of warning to all employees and persons near before a tree is felled.

Always fall every snag that is in anywise liable to blow over or fall on you while at work.

Always keep a lookout for loose limbs and sailors, and avoid the same.

Immediately turn in all tools not in proper shape or repair, notify foreman and procure others.

Buckers.—Be careful to cut all logs where measured.

Block up logs so that they will not split while bucking.

Always work on the upper side of a log on the sidehill, so as to avoid the danger of its rolling down on you.

Do not work near or under trees having loose limbs, or sailors, but first have same cut down.

At all times be extremely careful to keep away from lines, and from falling timber. In long timber the limbs frequently fly a long distance when felled.

Train Men and Construction Men.—Haul no logs until you are certain that the load is well balanced, secure and safe.

Never stand beside or near a train or load of logs that is in motion.

Do not get on or off the cars or engines while in motion, and do not walk over log cars while in motion.

Never stand between cars while coupling. (Logs often extend over the ends of cars).

Never get under a pile while it is being raised.

If you know or suspect any physical disability or inexperience in yourself or fellow-workman, immediately report same to your superior.

Foremen.—Always thoroughly instruct each man as to his work and the dangers thereof, and secure his consent before placing him upon any job involving danger.

Immediately discharge any habitual drunkard or man who comes to the camp in a drunken condition.

Immediately discharge any man who brings liquor to camp.

To All Foremen and Employes.

It is the intention and desire of this company that its employes at all times be very careful and keep out of unnecessary danger in every manner and form while employed at their work.

No man is to start at any kind of work unless he is thoroughly familiar with the dangers thereof, and fully capable of properly performing the work.

The following table shows the percentage of accidents occurring during the year 1915 in the operations of this company:

Logging, 27 per cent.; lumber (yards), 18 per cent.; miscellaneous, 16 per cent.; sash and door factory, 15 per cent.; mills, 15 per cent.; box factory, 7 per cent.; veneer, 2 per cent.

During the year 1915 there were 92 accidents of various kinds in the various departments of the company, as against 109 accidents for the year 1914. The above figures show percentage of accidents in the departments as noted.

Logging shows 27 per cent. of all acridents occurring, these being due to various causes. The majority of accidents in this department being injuries sustained by woodmen and others cutting feet, limbs, etc., with axes and other sharp tools. This cause and accidents on railroads provide the greater percentage of accidents in Logging Department. Accidents in Logging Department show an increase for 1915 over previous year, there being 23 accidents in 1914, as against 26 in 1915.

The Lumber Department (yards, kilns, etc.) follows, with a percentage of 18 per cent. The majority of these accidents being caused by employes falling off piles, falling lumber, etc. This department also shows an increase of accidents for 1915, there being 11 accidents in 1914, as against 16 in 1915.

Miscellaneous departments (ranches, store, teaming, etc.) shows a percentage of 16 per cent.

Sash and door factory and mills follow, with a percentage of 15 per cent. each, sash and door factory showing a reduction of 14 accidents over previous year. The mills show a reduction of 1 accident over last year's record.

The box factory takes the banner in the matter of reduction of accidents, there having been only 7 accidents in this department during 1915, as against 24 for 1914. Box factory showing a percentage of about 7 per cent.

The veneer plant shows the small percentage of 2 per cent., or 2 accidents for 1915, as against 5 in 1914. This department, however, employs only a small number of men in proportion to the other departments noted.

One fatal accident occurred during the year, this being in the Logging Department. However, this occurred during non-employment.

On the whole, the reduction in accidents over the previous year is gratifying to the management. Where the greatest reductions are shown over previous year, this is without doubt due to safeguards that have been installed and the efforts of the foremen and superintendents of the various departments.

In the departments showing increases in accidents, while it is possible to install guards in few places, the matter of safety practice is the main safeguard. This applies also to departments that have shown reductions, as fully 30 per cent. of all accidents occurring in 1915 were due to carelessness of the employe or his fellow-workman.

Every employe of the company should take upon himself individually the task of assisting foremen and superintendents to reduce still further accidents to themselves and their fellow-employes. They should acquire the safety habit. It is the only habit that will never injure you.

Cheaper Handling of Logs, Lumber, Refuse, Etc., Has Been Forced by the Increasing Cost of Labor and Materials

Jeffrey Lumber Refuse Conveyors are an absolute necessity to Mills of largecapacity, and are becoming more and more an indispensable accessory to Mills of smaller capacity.

Jeffrey Storage Battery Locomotives will haul Lumber Quicker and at Less Cost than any other method. They minimize fire risks; there are no cinders, smoke or fumes to contend with; no complicated system of trolley wires or expensive overhead construction required; no skilled labor required.

Progressive Ottawa Firm of Camp Equipment Manufacturers

Five years ago this fall, Messrs. Grant, Holden, Graham Limited, Ottawa, started business as manufacturers of tents, tarpaulins, lumbermen's and contractors' clothing. All the members of the firm had wide and practical experience along these lines, and an up-to-date factory of four storeys was opened on Albert Street. Within two years it was found necessary to double the capacity and during the

New factory of Grant, Holden, Graham, Limited, Ottawa.

next four years their business expanded until their connection extended from Vancouver to Sydney, and with war contracts on hand in addition to their regular business, they were working night and day with 400 employees to catch up with orders. In February of this year, however, fire destroyed their modern factory building. Nothing daunted, within 48 hours the indefatigable general manager, Mr. S. S. Holden, had the whole force working in temporary premises ready to take care of all orders, and plans under way for a larger and even more modern factory building.

The accompanying illustration shows the building practically completed and ready for occupancy. It is a modern seven-storey, absolutely fireproof building of steel and reinforced concrete, equipped with sprinkler system and latest lavatory equipment and modern dressing room for their employees. The first two floors will be devoted to general offices and warehouse space, with the remaining floors given over to manufacturing. All the latest and most modern machinery has been installed.

Grant, Holden, Graham, Limited, manufacture a full and complete line of lumbermen's and contractors' clothing furnishings, van goods and camp equipment, tents, tarpaulins, wagon covers and horse clothing. There is nothing in the lumbermen's needs in these lines they cannot supply. Four travellers cover the country from Winnipeg to Halifax in the interests of the firm, and Messrs. Finnie and Murray, of Winnipeg, handle all their lines for western Canada. The firm claim to have the largest exclusive tent factory in America and specialize in a full line of all kinds of canvas goods. About 600 men and women will be employed in the new factory. The personnel of the company consists of S. S. Holden, general manager; B. W. Graham, sales manager; and A. J. Hendry, warehouse manager.

The Calculating Machine for the Lumber Office

The accompanying illustration of the Dalton multiplying, dividing, and subtracting machine shows an appliance particularly adapted and almost indispensable to every lumber office.

The fact that there are only ten keys (one for each numeral) makes the operation of the Dalton exceedingly easy. Any one, from the office boy up, can operate it after a few minutes' instruction—can add long columns, find board feet of any number of any variety of different lengths of lumber, can extend totals, check up lumber and log reports and tally sheets, prove trial balances, make up pay rolls, etc.

Lumbermen who use the Dalton find that it fills the need in the lumber business for which all earlier styles of adding machines have proved inadequate.

The United Typewriter Company, Limited, of Toronto, are the

The Dalton multiplying, dividing and subtracting machine.

Canadian distributors of this machine, and they will be glad to send on request illustrated literature describing the Dalton and showing in what way it is so peculiarly adapted to the lumber business.

The Pacific Logging Congress and the "Forest Industry Conference," under the auspices of the Western Forestry and Conservation Association will be held at Portland, Oregon, from October 24th to 27th. The first day will be devoted to a discussion of forest fire prevention, the second day to current matters of vital importance to the lumber industry, and the third and fourth days to logging. Among the important subjects to be discussed under the head of logging will be, stumpage futures, salvage in cut-over land, timber insurance, legislation, and fire prevention methods. A large attendance is expected from Montana, Idaho, Washington, Oregon, California and British Columbia, also from Federal, State and Railroad representatives.

London, E.C., England

Lidgerwood Portable High Spar Skidder

Canadian Allis-Chalmers Company have just issued a new bulletin, No. 55, describing Lidgerwood Portable High Spar Skidders, the result of the continual development of the tree rig method of overhead skidding as first installed by the Lidgerwood Manufacturing Company, twenty-five years ago. This machine has the most modern devices of the kind for skidding logs, the deflection obtained in the main cable by the use of the high spar making long spans practicable. The Lidgerwood Manufacturing Company state that their skidders are the only skidders provided with interlocking drums, and with a mechanical slackpuller. These two devices result in high speed outhaul, skidding with the load in suspension, a reduction of the strain on engines and cables, and a saving of time picking up each load. This new bulletin will be sent to those interested, on application.

Gasoline Log Haulers Doing Good Work

Gasoline log haulers are coming into use in several parts of Canada, and according to the service they have already given, the prospects are that they will become a fairly general factor in logging operations wherever conditions are suitable. One of these tractors, manufactured by the Lombard Traction Co., Waterville, Me., is being operated by F. E. Sayre & Co., Ltd., St. John, N.B., who advise us that the total cost in Canada is about $5,500. This would include three sets of three sleds each. They leave one set of sleds in the yard, one set at the brow and keep one in transit. In this way the tractor is working steadily all day long. The tractor is doing the work of about eight pairs of horses. Theoretically, they say that it should do much better, but like all mechanical apparatus it is liable at times to give out. In operating the gasoline log hauler, F. E. Sayre & Company say it is best to get a thoroughly competent man to run it, and also that it is wise to build a proper shed to keep it in and to have the shed heated.

In operations where the logs are not hauled more than four miles, they believe they can, in practice, be hauled cheaper with horses, if the operator is so situated that he does not have to own his horses, but can hire them per pair with driver at from $50 to $60 per month. On hauls of from four to six miles, they find that the tractor is superior to horses. It can be operated for a day of about nine hours on a consumption of 25 gallons of gasoline and two gallons of lubricating oil, and it will work satisfactorily at a temperature of 30 below zero. Fifteen per cent. of the total cost of the tractor would cover the up-keep and depreciation.

An operator who may be thinking of purchasing a tractor can figure out his requirements from the following suggestion. On a six-mile haul, with two and one-half months hauling time he would need to figure on one log hauler for every million feet of logs.

The gasoline tractor will operate on a first class horse road and will make its turning almost any place where it will be sufficient for a pair of horses to turn in.

Other operators in eastern Canada have also told us of success which they have had with this class of machine.

Contract Logging Preferred by Eastern Operators

The York & Sunbury Milling Company, Gibson, N.B., who have all their logging done by contract in preference to establishing their own camps advise us that they find this way of doing business much preferable. There are many reasons why they favor it. Chief among these is the fact that their operations are scattered over considerable territory, necessitating several camps many miles apart, for operations from one-half to two millions each. They have not the necessary camp equipments for so many operations, nor are they able to find competent woods foremen to take charge of each operation. Of course, they employ a competent woodsman who has a general supervision of the work and their contracts require that the work must be done to his satisfaction.

Most of the logging operators in that part of the country have their own camp equipment and are accustomed to doing work under contract. The manufacturers claim that the work can be done better and with less expense when the operator has a money interest in the work of his crew, and the manufacturer is relieved of so many details.

In connection with their manufacturing operations at Pokiok, N.B., the York & Sunbury Milling Company have installed a log chute from their mill pond to the St. John River, a distance of about 500 feet, through which they sluice two to three million feet of logs each year. These they raft and tow to their Gibson mill, about forty miles below, using motor boats for this purpose.

The Toronto Blower Co.,
City.

Dear Sirs:-

I have pleasure in writing this letter in regard to the Blower Systems you installed in my factory last year. Both the shaving and the separate sawdust systems are working very satisfactorily and I know we have as good a job of piping as it is possible to put up. This work was done under the direction of your Mr. Daniels, whom I consider a very good mechanic.

Yours truly,
T. H. Hancock

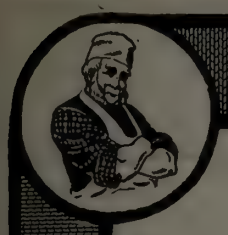
Let us show you how to Save Money on your Exhaust System.

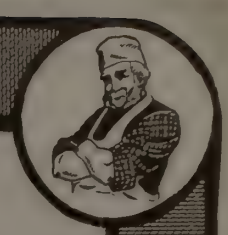
To reduce costs and save money your Exhaust System should be 100 per cent. efficient. You should get full value for every dollar spent for power. Our system gives service and reduces cost because it is properly installed and because

OUR "FOSTER" BLOWER

is skillfully designed and strongly constructed. Our special "Foster" Sawmill Blower will blow your green sawdust any distance. Write us about your exhaust system troubles. We remodel and install Blower Systems that save you money. Let us prove it.

Toronto Blower Company, 156 Duke Street, TORONTO





CAMP FOOD

A whole lot depends on the food your men get to keep them in the glowing health necessary for strenuous camp work. Their food should be made from the best flour it is possible to secure.

Cream of the West Flour

the hard wheat flour that is guaranteed for bread

has the reputation of being the most wholesome, nourishing flour on the Canadian market. Lumber camps are learning more and more, the best is cheapest in the long run.

Your horses need special camp feed, too. Our Crushed Oats, Mixed Crushed Feed and Chop are the very finest grades of feed for camp use. You'll notice the difference in good work done by your horses in a short while after using these products.

EDGINGS

Ontario

The Lincoln Paper Mills, Merritton, Ont., are contemplating the addition of a sulphite mill to their plant at a cost of $200,000.

Stevens' sawmill and stock of lumber near New Liskeard, Ont., were destroyed by fire in the forest fires occurring in that district on August 22nd.

A report from Arnprior, Ont., states that McLachlin Bros.' sawmills at that point have closed down after a run of only three months, this being one of the shortest seasons they have ever experienced. The firm, like all others, had a great deal of trouble during the summer with the labor question, and finally concluded that it was advisable to close down. Many of the employees have since found situations at Braeside, Pembroke and other points.

The two associated firms of Cockburn, Whaley Company, and Knight, Cockburn and Whaley, wholesale hardwood lumber merchants, Guelph, Ont., are being dissolved and are reorganizing. Mr. H. G. Cockburn, the founder of the business, who has been an active member of both companies is taking in with him his own son, Mr. H. R. Cockburn, and will continue to conduct a wholesale business under the firm name of H. G. Cockburn and Son. They will occupy the same offices, in the telephone building. It is understood that Mr. Knight and Mr. Whaley will conduct a business under the name of the Knight Whaley Company.

Eastern Canada

The Ha Ha Baie Sulphite Company, Chicoutimi, P.Q., are contemplating the erection of a paper mill in conjunction with their pulp mill now in progress of construction at Bagotville, P.Q.

The Albert Lumber Company, Hillsboro, N.B., finished their season's cut on August 11th, having turned out 3,000,000 feet. The mill was shut down for repairs less than half a day during the season.

A report from North Sydney, C. B., states that an area of 200 square miles of timberlands at Bonne Bay, Newfoundland, has been sold by Messrs. Vibert, Sydney, and Jos. Salters, to an English syndicate.

The sawmill belonging to Alex. Gagnon, of Chicoutimi, P.Q., was recently destroyed by fire. The origin of the fire is unknown. The loss is estimated at about $40,000. The insurance carried amounted to $15,000.

Work has been started on a paper factory and power house at a cost of $84,000 by the Thompson Norris Company, 355 Notre Dame East, Montreal. The building is to be four storeys, 102 x 190, reinforced concrete and brick construction.

A contract has been awarded by the Canada Paper Company, Limited, Windsor Mills, P.Q., to F. Byers, & Company, Limited, 340 University Street, Montreal, for the erection of paper mills to cost $30,000. The building will be two storeys, 128 x 57, and will be of reinforced concrete and brick construction.

With the proceeds of the half million dollar 6 per cent. collateral trust notes now being issued by Price Bros., Limited, the company will make a further addition to its paper making plant and also construct a storage dam. It is officially stated that the company's annual output, with additions under construction, will be one hundred million feet board measure of merchantable lumber, 72,000 tons of newsprint, 58,000 tons of ground wood pulp, and 25,000 tons of sulphite pulp. The company has sold its pulp and paper output for the next six months, and also its lumber output for the current year. The net earnings for the fifteen months ending February 29 last totalled $550,209, after allowing for all interest charges.

Western Canada

The Saskatchewan Door Company, Weyburn, Sask., recently lost their door factory by fire. The amount of the loss is not yet known.

The Empire Pulp and Paper Mills, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $2,500,000, to carry on business as manufacturers and dealers in pulp, paper, timber, lumber, etc.

D. R. Rolston, Limited, has been incorporated with head office at Golden, B.C., and capital stock of $10,000, to carry on business, among other things as sawmill men, lumbermen, timber merchants and manufacturers and dealers in lumber, cordwood, etc.

Brooks Bidlake Cedar Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $50,000, to carry on business as timber merchants, lumber merchants, sawmill, shingle mill and pulp mill owners, loggers, etc.

The Pacific Logging Company, Limited, has been incorporated with head

office at New Westminster, B.C., and capital stock of $40,000, to carry on business as foresters, loggers, timber and lumber merchants, sawmill and planing mill proprietors, etc.

Sealed tenders are being received by the Minister of Lands for B. C., until the 11th day of October, 1916, for the purchase of License X645, to cut 9,396,000 feet of Douglas fir, cedar, hemlock, balsam, spruce and white pine on an area adjoining Lot 654, Topaze Harbour, Range 1, Coast District. Two years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for B. C., until the 13th day of September, 1916, for the purchase of License X248, to cut 7,773,896 feet of Douglas fir and cedar, 20,115 lineal feet of poles, and 6,900 lineal feet of fir piling, on an area adjoining S. T. L. 37502, Lake Bay, Read Island, Sayward District. Three years will be allowed for the removal of the timber.

The Ladder Lake Lumber Company, Prince Albert, Sask., report that they have had a very successful drive this season, having floated all of their season's cut to the mill and also 30,000,000 feet which had been lying at Crooked and Otter Creeks for five years, which it was thought could not possibly be brought down. These logs had been taken out by the Big River Lumber Company.

Sealed tenders are being received by the Minister of Lands for B. C., until the 11th day of October, 1916, for the purchase of License X703, to cut 1,066,000 feet of Douglas fir, cedar, larch, yellow pine, white pine, cottonwood and dead and down timber; also 14,000 cedar poles and 86,000 railway ties, covering that portion of Lot 274, Kootenay District, situated south of the Goat River. Two years will be allowed for the removal of the timber.

Russia Negotiates for Box Cars

According to a despatch from Chicago, demands for an enormous quantity of lumber to be used in connection with the construction of freight cars for the Russian Government may soon appear on the general lumber market in consequence of arrangements said to have been made by New York bankers, on a trip to that country. It is believed that contracts are being negotiated for between 40,000 and 50,000 freight cars for that government, and as New York bankers are interested in the making of a loan to the government it is likely that orders for a large number of these cars will be placed. Orders for the number mentioned would necessitate the consumption of between 140,000,000 and 175,000,000 feet of lumber. The first move in the campaign of extending the freight equipment of the Russian Government is seen in the recent awarding of contracts by the Imperial Munitions Board at Ottawa, Ont., for 7,000 box cars for the Russian railroads.

U. S. Imports of Canadian Wood Pulp Greatly Increased

According to a Washington, D.C., despatch, over two-thirds of the more than a billion pounds of wood pulp imported into the United States during the fiscal year ending June 30, 1916, and used in the manufacture of paper, came from Canada. The pulp importations for 1915-16 have been 180,000,000 pounds less than for the previous twelve months, yet the amount shipped to United States from Canada during the past year was 130,000,000 pounds in excess of her 1914-15 shipments. During the year just closed nearly 70 per cent. of 1,135,000,000 pounds of pulp imported came from Canada, while most of the remaining 30 per cent. came from Norway and Sweden.

In the case of Price Bros. Limited, vs. the Shives Lumber Company, judgment has been handed down by the Superior Court at Rimouski, in favor of the Shives Lumber Company. The action was taken by Price Bros., who claimed $3,616 for timber which they alleged was cut by the Shives Lumber Company on their property on the upper waters of the River Rimouski, the amount claimed being on a basis of $1 per tree.

Hart & McDonagh, wholesale lumber dealers, Continental Life Building, Toronto, report that they have purchased a block of birch and spruce lumber from the Rideau Lumber Company of Ottawa. The block includes over 6,000,000 feet. This new firm of wholesalers report that they have met with escouraging success during their first season's business.

J. B. Wall, of the Buffalo Hardwood Lumber Company, Buffalo, N.Y., who with his brothers, M. M. Wall and T. H. Wall are owners of extensive timber resources in British Columbia, is on a tour of inspection of this property with a view, perhaps, of the Wall interests starting lumber operations there in the near future if conditions warrant.

The lumber dealers, contractors and carpenters of Hamilton, Ont., held their annual picnic to Niagara Falls on August 19th and as usual enjoyed themselves to the limit. The attendance amounted to nearly one thousand.

We handle

Everything in Lumber

We can offer at very attractive prices, if interested, the following:

WHITEHEAD & TURNER

WHOLESALE GROCERS

QUEBEC

They Saved 25% in Fuel and 50% in Repairs

SO WRITES Mr. Wm. H. Turner, secretary and treasurer of **The Easton Furniture Company**, of Easton, Md., after giving the "Morehead" system a thorough trial.

Until you are draining the condensation from your kilns and returning it—every drop—to the boilers at the **original temperature**—

—you are wasting heat units that **cost** you DOLLARS to produce.

STOP THAT WASTE!

Rejuvenate your entire steam plant by making the inexpensive "Morehead" system a part of it.

Save **fuel** by bringing the pure condensation directly back to the boilers HOT!

Save **repairs** by eliminating forever the necessity for the wasteful and constantly out-of-order steam pump. The simple, easily installed "Morehead" system will much more than pay for itself the first year of use.

Write for the proof to-day.

The "Morehead" book shows actual photographs of some interesting installations. Don't you want your copy at once?

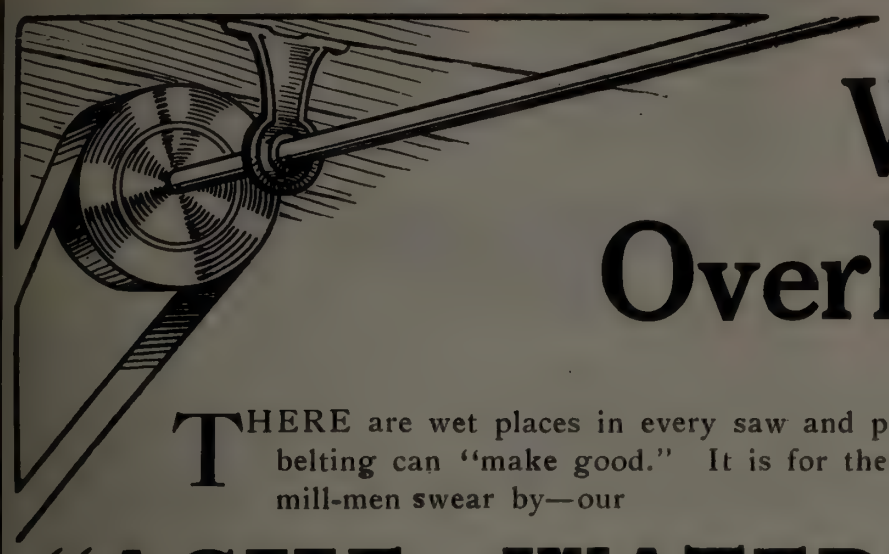
"Wilson Bros." Hardwood Flooring

is the Flooring that is manufactured expressly to supply the demand for the best. It is made by modern machinery from carefully selected stock, and every precaution is taken throughout our entire system to make it fulfil the requirements in every particular. Write us for prices.

Wilson Bros., Limited - Collingwood, Ont.



When You Overhaul Your Mill

THERE are wet places in every saw and pulp mill where nothing but the highest class belting can "make good." It is for these wet places that we recommend what most mill-men swear by—our

"ACME WATERPROOF" BELT

This belt is especially made for a rough and trying service. It has less stretch than any other belt by 15 to 25 per cent.

When you are overhauling try a Goodhue "Acme Waterproof" belt. The Goodhue belts are "Extra" and "Standard."

Prices and Particulars on Request.

J. L. Goodhue & Company, Limited

DANVILLE - QUEBEC

Shell Box Makers

Are you using SHIMER CUTTER HEADS on your Box Board Machines?

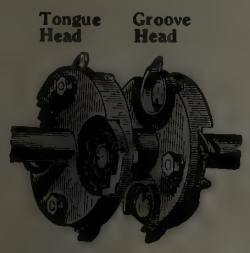

Fig. 62

The Shimer Cutter Heads for matching box lumber are the only heads that give you a perfectly jointed edge to your lumber assuring you of an absolutely tight joint on both edges of the wood.—See illustration above.

NOTE:—These Heads are made with four, six or eight cutters each, according to speed of machine.

Made to fit any Box Board Machine on the market.

If you are not using these Tools write us for prices and further information.

Forest Loader and Portable Derrick

A GREAT MONEY SAVER

Repeat orders have resulted wherever installed, on account of its remarkable efficiency, and the smallness of its initial cost and its small cost of operation.

Develops a Lifting Power of 8000 Pounds

This machine can be hauled from one skidway to another, all set up and ready to work, requiring only guy lines to be fastened to tree or stump. Very efficient for loading cars with, log piling or timber.

Five of these machines are now being used every winter by the Shevlin Clarke Company, of Fort Frances, Ontario. and they are also being used by other important lumber manufacturers. Descriptive Catalogue on request.

Manufactured by

WOODSIDE BROS., - PORT ARTHUR, ONT.

WATEROUS

SAWMILL MACHINERY

Is Mill Equipment That Spells Satisfaction

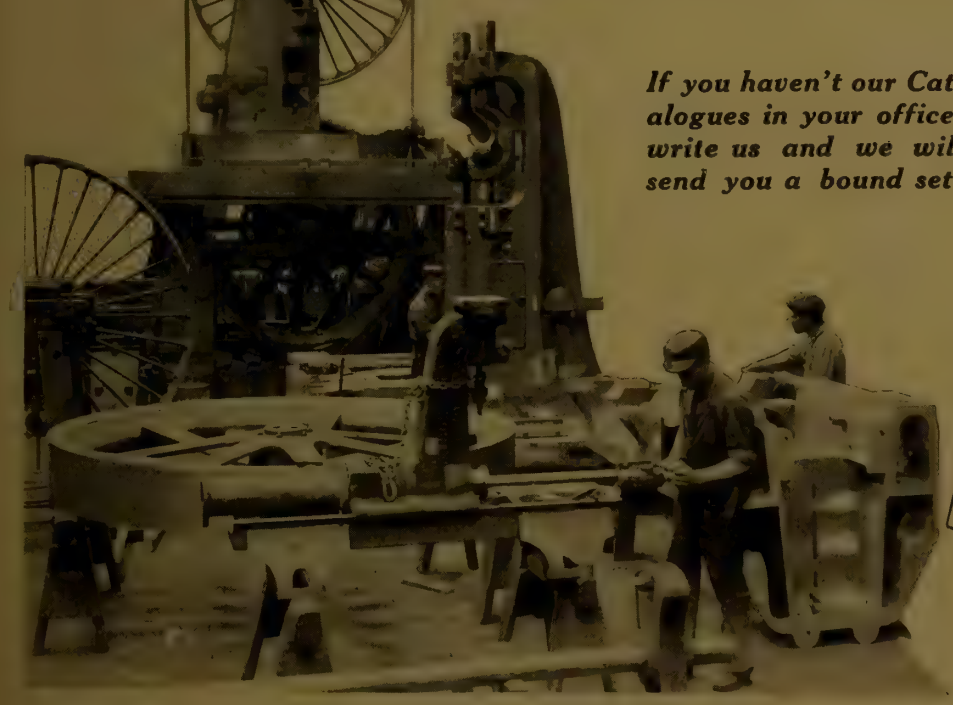
Whether you operate a portable outfit or a 150,000 ft. capacity mill, Waterous Sawmill Machinery will give you results that count on the right side of the ledger. It contains all the time and labor saving improvements that modern sawmilling demands. More than that, every machine, even in our very lightest outfits, is built with a strength and sturdiness that means years of service more than you'll get from other makes.

Waterous Sawmill Machinery has kept abreast of the times, or a little ahead. Recent additions to our line :

The "New Model" Bandmill
Trout Power Set Works
Combination Setter and Receder
Waterous Kendall Circular Gang

—all have been designed to cut down operating costs and to speed up production.

We have built Canadian Sawmill Machinery for more than fifty years. We have the experience and we have the shops, the biggest in Canada building sawmill equipment, to back it up.



If you haven't our Catalogues in your office, write us and we will send you a bound set.

Everything for the Sawmill

Chains of all kinds
Bullwheels and Conveyors
Bandmills—6', 7', 8', 9' and 10'
Steam Log Deck Equipment
Edgers — Light, Medium and Heavy
Trimmers—Two-saw and Automatic
Circular Saw Frames
Live Rolls and Drives
Circular Gangs
Circular Re-Saws
Power Plants Complete
Filing Room Tools

All Made in Canada

And Here is Why:

Built in 8, 9 and 10 ft. sizes, there's a Waterous Bandmill for every kind of work.

The spring-cushioned, all knife edged tension device is the most sensitive in use.

Upper and lower guides swing about the exact centre of the saw blade.

The Upper Guide is raised and lowered by steam, and easy, accurate and swift adjustment unequalled by any other.

Wheel raising device and tilting device are roller bearing. Operating mechanism is entirely enclosed in columns. Sawdust and slivers cannot reach it.

Massive design of the bed and columns precludes vibration during cutting. This mill is absolutely steady doing the heaviest work.

Every part of the mill is designed to make mill-wrighting easy. Adjustments and inspections can be made without difficulty.

Waterous Bandmills are designed and built in a plant that has specialized in the manufacture of Canadian sawmill machinery for more than 50 years. It counts.

LOGGING EQUIPMENT

How is your supply of logging tools? If in the market for new equipment let us figure on your requirements for

PEAVIES	BOOM CHAINS	LOG STAMPS
CANT HOOKS	SHACKLES	HAMMERS
TIMBER DOGS	MILL CHAINS	FORGINGS, ETC.

Our products are the result of over 50 years of careful study of the lumberman's requirements. We can offer the best equipment at the lowest price.

THOMAS H. ARGALL

Three Rivers, :-: QUEBEC

Fire Protection—and Insurance.

WILL NOT BECOME WATERSOAKED

Made of Fibreware, Moulded and Hardened under enormous hydraulic pressure and Baked at extreme heat

The Finished Article gives almost everlasting wear

WE do not advise You to under-insure your property, but we say that if Eddy's Round-Bottomed Fire Pails are part of your Fire-fighting equipment you will likely get a lower rate than you otherwise would have done.

EDDY'S Firbreware Fire Pails are made with a specially constructed Rounded Bottom so that they must be stood or hung in Racks where every body in the Factory or Mill knows where to find them when necessary.

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. **Price 30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

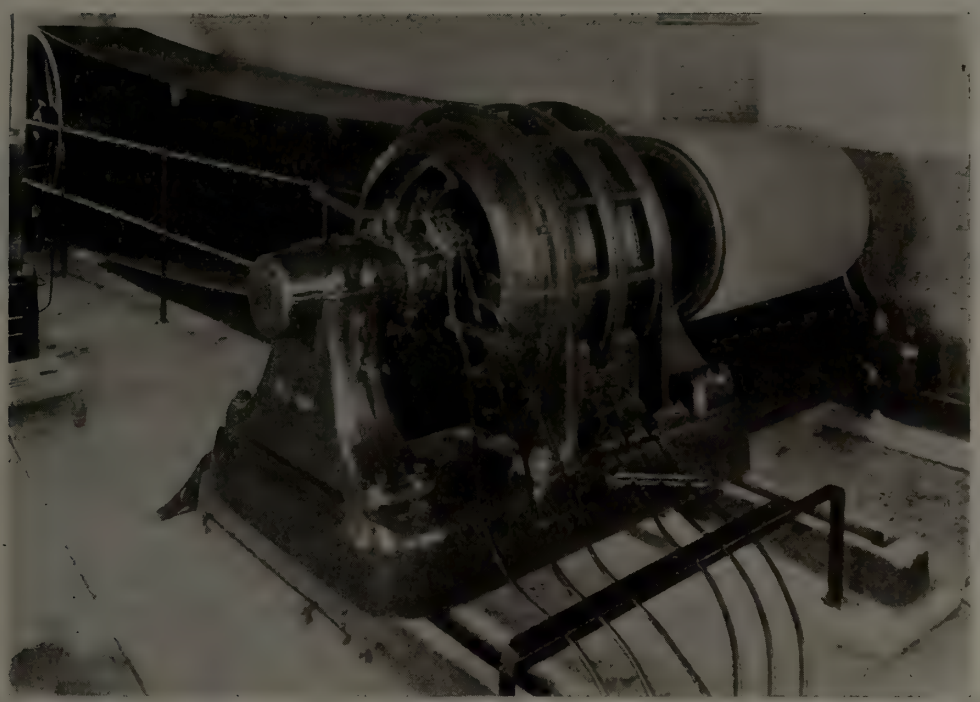
AGENCIES EVERYWHERE

A Main Drive That Won't Stretch



The above photograph is 75' x 48" x 10-ply Leviathan Belt

The motor is a Canadian General Electric 500 H., 3 Phase, 60 cycle, 2300 volts, 600 R.P.M. The belt has never been taken up or relaced since it was installed, August, 1914, over two years' service.

LEVIATHAN or ANACONDA

belts do not stretch, there is no upkeep cost or loss of production by having to shut down to take up the belt.

This belt drives a line shaft that has fourteen dry pans; all these dry pans are equipped with 16" x 8-ply LEVIATHAN belting. There is no other brick plant in Canada or the United States that has fourteen dry pans on one line shaft.

Another ANACONDA 48" by 10-ply in this same plant replaced triple leather that was only in service two years. The upkeep cost of that leather belt was so expensive that they replaced it with ANACONDA.

Are you willing, is your Power Department willing to stop thinking of belting in terms of material and consider it in the light of power delivered, strength, tractive qualities, economy of upkeep, length of life, and after these are considered, cost of installation?

Barienger Brake

A Saver of Life, Time and Money

The famous Barienger Braking Device, as used in logging operations throughout Canada and the United States, has proved a great success. It has reduced the cost of road building, made shorter hauls possible, and practically eliminated accidents to horses and men. Timber considered inaccessible is now easily taken out with the aid of Barienger Brakes.

Our catalogue describes in detail the construction and use of this brake.

CONTINUOUS SERVICE

To-day the aim of every manufacturer is to attain Uninterrupted Production. Maintenance of this Production is possible only through continuity of operation, and Transmission of Power is a prime factor in rendering Continuous Service.

In Great Beehives of Industry and in the smallest and most Remote Mills, G & K Belting is used as the means to Uninterrupted Production. Drives which were a constant source of trouble are now highly productive,—saving loss of time and cost of replacement,—increasing output and lowering unit cost.

You, too, will find that G & K Belting is more than just good belting, that it incorporates the quality, strength, pliability, and firmness, so essential to the day-in and day-out efficient transmission of power. You will find a brand for every drive, every condition of service,—you will find the belt especially suited to your requirements.

Catalog, Samples, Engineering Advice, and complete details furnished cheerfully upon request. May we assist you toward Continuous Belting Service?

ATKINS
BAND and RE-SAWS

We have achieved an enviable reputation for supplying SAWS which stand up to their work longer, with less re-fitting than any other SAWS in the world. If there is any doubt in your mind, we stand ready to prove it to you.

A Perfect Saw for Every Purpose

Send for our 248 page book on Saws. The most valuable and interesting Saw book ever published. Tells you just what you want to know about SAWS, MACHINE KNIVES and SAW FITTING TOOLS.

For Logging Operations, Bush Work, Camp Lighting and Saw Mill Use

The Carbic Light

Carbic Light gives a clear, white light of from 500 to 5000 candle power. One filling of Carbic Cakes will keep the lamp burning steadily twelve hours.

This system of furnishing light in isolated places is especially adaptable for use in lumber camps and also for actual bush operations. The ***Carbic Light*** is the newest and certainly the most simple and efficient method of producing a steady volume of brilliant white light, the volume of which can be regulated by our patented burner.

100 Candle Power

BRIGHT as DAYLIGHT

By comprising Raw Carbide into solid cakes we produce ***"Carbic."*** In combination with our simple burners and generators you can secure a hand portable or stationary light of almost any desired candle power. The Carbic Cakes are simply dropped into the machine as required and each of these cakes will produce approximately 15 cubic feet of pure acetylene. When lights are turned out generation of gas stops, and is resumed when lamp is again lighted. ***There is no waste.*** The cost of maintenance is small. For instance, the operating expense of the Carbic Hand Lamp No. 7 (as illustrated on the left) is 1 cent per hour. It will burn ten hours on one Carbic Cake, giving approximately a 100 candle power light.

We have an interesting catalog describing the Carbic Light.

It is Free. :-: Send today.

See Our Exhibit in Machinery Hall, Canadian National Exhibition.

2000 Candle Power

W. L. FOSTER

Canadian Agent - 8 Lombard St.

TORONTO

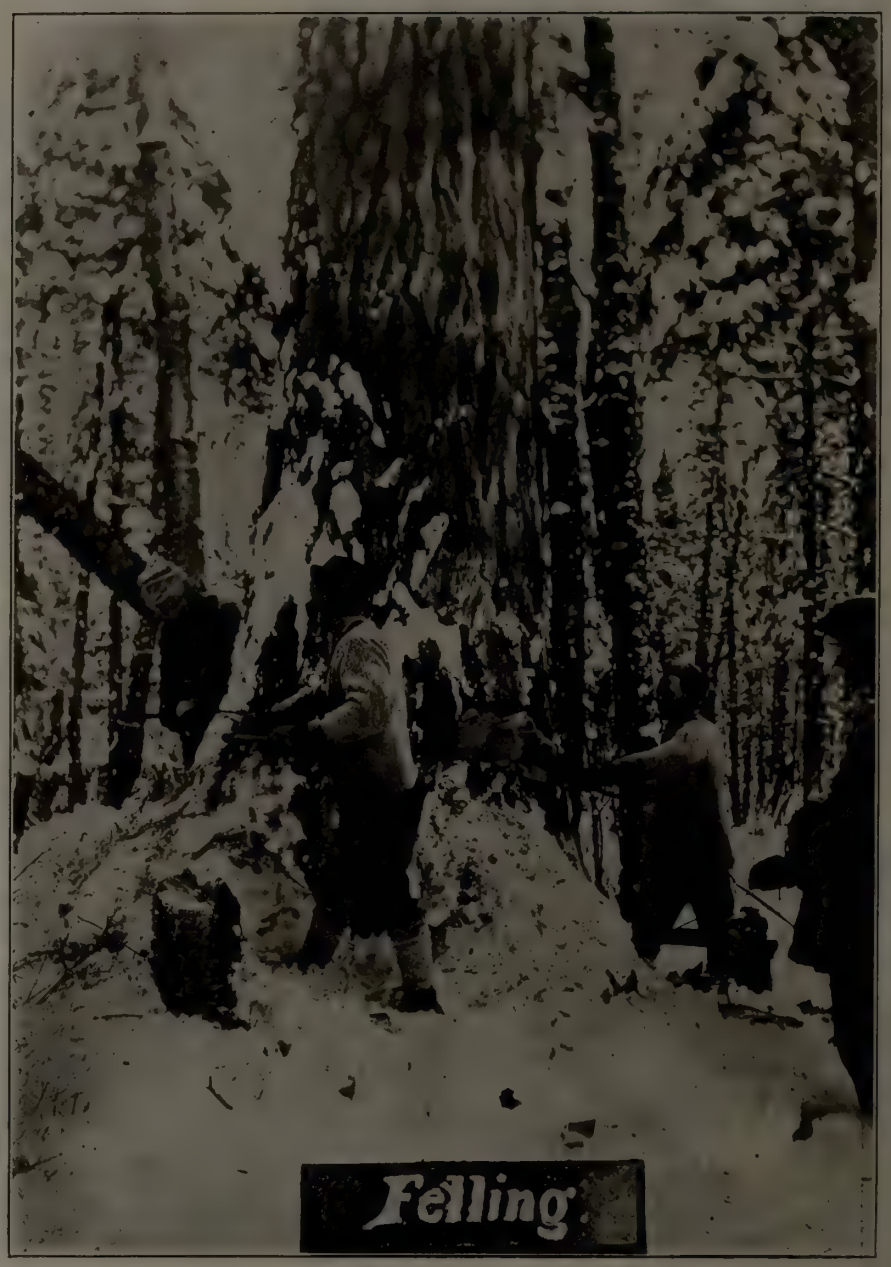
ONTARIO
Canada's Banner Province

Ontario's timber resources are unrivalled.

No other country possesses such a variety of hard and soft woods.

Ontario forests are adjacent to the greatest waterways of the world—the mighty rivers and lakes provide unusual facilities for the lumberman.

Three Transcontinental Railways across the Province eliminate transportation difficulties.



Ontario's wood working industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of wood used in the Ontario industries purchased within the Province.

Ontario leads in production of hardwoods, cutting twice as much as Quebec, second on the list.

Ontario has unlimited quantities of Spruce and other soft woods suitable for the pulp and paper industry.

Tremendous pulp areas are yet untouched.

Ontario's pine producing areas outclass those of any other country in the world, both in extent and quality of the timber.

Exporters to the European markets should investigate the opportunities Ontario offers for the supply of Dimension Timber, Pit Props, Poles, Shook Boxes, Etc.

For maps of the Province and timber regulations apply to

Honorable G. H. Ferguson,
Minister of Lands, Forests and Mines,
Parliament Buildings, TORONTO, CANADA

HOE *Chisel Tooth* SAWS

Hoe saws run true and keep their edge longer, because of inbuilt quality and expert workmanship. Nearly 90 years of saw making experience stand back of our product. The first saw made in America was stamped with the name "HOE." Now-a-days when lumbermen want Hoe products they simply ask for "The Best."

For Hard Steady Work—*Hoe Has No Equal*

Over 100,000 Hoe Saws now in use. Let us send you catalogue and price list of the different sizes.

R. Hoe & Co.

504-520 Grand St.
NEW YORK CITY

Three boilers fitted with Jones Underfeed Stokers at Dells Paper & Pulp Mills, Eau Claire, Wis.

Jones Stokers Cut Your Coal Bill 99%

A saving of 99% in the coal bill of a pulp mill is the result of an installation of Jones Underfeed Stokers. They are used in conjunction with Dutch ovens for utilizing as fuel the mill's refuse. This is not a theoretical result but an actual reality which is taking place daily in the plant of the Minnesota and Ontario Power Company's mills.

Substantial savings can be made in your saw, planing or pulp mill.

Write us about your conditions and let us tell you of the economy that can be brought about by the installation of Jones Stokers.

Literature and full particulars gladly furnished upon request.

128,350 Laths in Ten Hours

Our Lath-Mill and Bolter have made a test cut in ten hours of 128,350 four foot Laths, 1½ in. by ⅜ in., counted, tied and piled, as will be seen in the following letter:—

Five-Saw Lath Mill

Messrs. P. Payette & Co.,
Penetanguishene, Ont., Can.

Dear Sirs,—I thought I would drop you a line and let you know of the record Lath-Cut we made on your machines on June 29th, 1910.

We made 128,350 four-foot laths, 1½ in. x ⅜ in., counted, tied and piled, in ten hours steady cutting from mill-run, and from slabs and edgings we had saved out, in order to keep the machines cutting their full capacity.

We used your No. 1 Four-Saw Bolter, and your No. 2 Five-Saw Lath-Mill, and had two Lath-Shovers and two Lath-Tiers, in order to keep up this speed.

This shows extremely well for your Lath Machines, not only for the tremendous cut, but they ran the full ten hours without a bearing getting hot or any stoppage whatsoever, and making first-class laths.

I therefore take great pleasure in recommending P. PAYETTE'S LATH - MACHINERY to any person requiring up-to-date machinery.

I remain,
Yours sincerely,

D. J. MacMILLAN,
Lath-Maker for C Beck Mfg. Co.,

Conveyed More than 700 ft. by Sturtevant Fans

TRADE MARK

Photograph shows part of a dust collecting and conveying system at the B. & M. R. R. Shops at North Billerica, Mass. At the right is the carpenter shop with cillector on roof, and at left is the power house where storage bins and furnace feeders are installed. This system serves a large number of machines in the wood-working shops and a large number of Sturtevant Planing Mill Fans of different sizes handle the material.

The two great features of Sturtevant Planing Mill Fans are—(1) low power consumption, (2) dependability. In fact we have planing mill fans which have been running for thirty and thirty-five years, and the fans we make to-day are built with the same merit and with the same care as characterized our early product.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

HARD SERVICE LOCOMOTIVES

Because of the severe conditions under which small locomotives must frequently operate, they must be built with the greatest care. Operation at a distance from shops or other repair facilities is not unusual

This class of equipment must be simple in design to be easily accessible for repairs.

They must be properly proportioned, must have necessary strength in each part, and must be ready for service at all times.

Our standard light locomotives embody the most modern construction, are built for the hardest service and to do the most work for the least cost. They are simple in design and easy to repair.

We can make immediate shipment of locomotives of various sizes.

MANUFACTURING WOODWORKING

Machine Knives, Circular Cutters and Mortise Chisel

Cut filing costs in half

Filing is like drilling. The moment the file wears smooth, it takes twice, or three times, the energy to accomplish the desired result. Engineers have got it down to a scientific basis in drilling. The moment a drill reaches the "inefficient point" it is discarded, and this "efficient point" is determined by the amount of power used to drill a certain dimension.

Workmen are not machinery; consequently you have to depend upon the personal element and educate your men up to the point where they will know at once when their files have reached the "inefficient point." If you educate your men to this, you will get double the results at the bench, compared by results when men have been working with files that are "inefficient."

The Famous Five are:

Kearney & Foote ***Great Western***
American ***Arcade*** ***Globe***

(Made in Canada)

Write for our booklet "File Filosophy." It is well worth reading by any manuafcturer, shop superintendent, shop foreman or workman who is concerned with the use of files.

"AMPHIBIA"

Planer Belting

Amphibia Planer is one of the very few brands of Leather Belting that will give really satisfactory service in the Lumber Industry.

The results of exposure, oil, grease and greenwood on ordinary leather, renders a very special waterproof tannage absolutely necessary when preparing the leather for transmission purposes.

"Leather like gold has no substitute."

A mere description of this process as used in Amphibia Planer would not convince you. What you want is results. You want continuous wear and perfect power transmission on every shaft and pulley.

Hundreds of large firms are securing this service right now with Amphibia. We believe you are just as progressive as the best in the country and we want you to try a sample run of this better leather belting.

IT'S WATERPROOF

Write us today. Say under what conditions you want the belt to run. We will recommend an Amphibia Leather Belt for your purpose that will break all your previous records for economy in full power generated and transmitted and in low up-keep.

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 8-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 80 h.p. Generator, 250 volt.

1 80 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

Morgan Machine Company

ROCHESTER, N. Y.

THE HAZARD of RAISED GRAIN

Is one which some architects still use as an argument against any southern pine for white enamel treatment. This is due to their apparent belief that all yellow pine at least, is alike.

Raised grain however, is a contingency only when the enamel is put upon pine of heavy resinous content, which must necessarily be shellaced before the priming coat of lead and oil is applied. When the shellac comes in contact with the rosin streaks, it causes the latter to raise, which brings about the undesirable final effect.

ARKANSAS SOFT PINE

Interior Trim is virtually free from rosin, has a tough fibre and fine grain and **does not** require preliminary shellacing. Instead, after proper sanding, the lead and oil priming coat is applied direct to the raw wood so that a perfectly even absorption takes place. **No raising of the grain occurs.** When the enamel undercoating and finishing coats are finally completed and rubbed, the ultimate effect is a mirror-like surface which will satisfy the most exacting architect or home-owner.

Dealers who are alert to their opportunities will see that their trade is supplied with Arkansas Soft Pine Interior Trim.

All stock bearing the Arkansas Soft Pine Trade Mark is manufactured and sold exclusively by the following companies:

On What Shall We Quote:

Arkansas Land & Lumber Company, Malvern, Ark.
Arkansas Lumber Company, Warren, Ark.
Cotton Belt Lumber Company, Bearden, Ark.
Crossett Lumber Company, Crossett, Ark.
Eagle Lumber Company, Eagle Mills, Ark.
